		11. CONTRACT OR GRANT NO.	
12. SPONSORING AGENCY NAME AND ADDRESS National Aeronautics and Space Administration Washington, D. C. 20546		13. TYPE OF REPORT & PERIOD COVERED Technical Memorandum	
		14. SPONSORING AGENCY CODE	
15. SUPPLEMENTARY NOTES Prepared by Product Engineering and Process Technology Laboratory, Science and Engineering			
16. ABSTRACT This document contains data and illustrations concerned with commercial and Government flat conductor cable (FCC) connecting and terminating hardware which is currently available or is in development. Material was obtained from a NASA-sponsored, industry-wide survey conducted from August 1970 to December 1970 and has been separated into two major sections. One consists of component data sheets with information compiled from questionnaires. The other contains additional manufacturer-supplied information, such as photos, illustrations, and component family data sheets.			
EDITOR'S NOTE Use of trade names or names of manufacturers in this report does not constitute an official endorsement of such products or manufacturers, either express or implied, by the National Aeronautics and Space Administration or any other agency of the United States Government. No aspect of this report (with the exception of manufacturer-supplied data in Section IV) may be reprinted without the expressed written permission of NASA. Permission to reprint any manufacturer-supplied material in Section IV must be obtained from the individual companies.			
17. KEY WORDS Flat Conductor Cable (FCC) Connector Flexible Cable Plug Receptacle Transition	18. DISTRIBUTION STATEMENT For Public Release as Announced in STAR 		
19. SECURITY CLASSIF. (of this report) Unclassified	20. SECURITY CLASSIF. (of this page) Unclassified	21. NO. OF PAGES 305	22. PRICE \$6.00

PREFACE

This document was prepared from information obtained during a survey conducted by Candace Swanson and Glenn Walker of Hayes International Corporation. The work was performed to fulfill the requirements of a Technical Directive issued by the Manufacturing Research and Technology Division, Product Engineering and Process Technology Laboratory, George C. Marshall Space Flight Center, Huntsville, Alabama.

Special thanks go to the contributing manufacturers listed on pages vii and viii. As additional material becomes available, revisions will be made to this document. Any company desiring to have applicable data included should contact

Mr. J D Bennight
Chief, Electrical Development Branch
S&E-PT-ME
NASA MSFC
Marshall Space Flight Center, Alabama 35812

GLOSSARY

Company Abbreviations

AMP — AMP Incorporated

Ansley — Ansley, Division of Thomas & Betts Corporation

Belling and Lee — Belling and Lee of Enfield, England, represented in the United States by the Ercona Corporation

Berg — Berg Electronics

Burndy — Burndy Corporation, Tape Cable Division

ITT Cannon — ITT Cannon Electric Inc., Phoenix Division

Kings — Kings Electronics Company Incorporated

Malco — Malco Manufacturing Company Inc.

Methode — Methode Electronics, Incorporated

Microdot — Microdot Incorporated, Connector Division

NASA — NASA, George C. Marshall Space Flight Center

Thomas & Betts — Thomas & Betts Corporation

Connector — Mated separable plug and receptacle, designed to connect a cable with another cable, printed circuit board, box or component.

Flat Conductor Cable (FCC) — Cable consisting of flat parallel conductors laminated between thin flexible plastic insulating films, or otherwise held in a regular flat configuration.

Flexible Circuit — Circuit consisting of etched conductors laminated between insulating material. The circuit is usually asymmetrical and designed for a specific application.

Housing — Outermost part of a plug, receptacle, or transition. Frequently referred to as the shell.

Overall Mated Dimensions — Total depth (D), width (W), and height (H) or diameter (Dia) and Length (L) of a mated connector; including mounting, latching, and safety devices.

Overall Unmated Dimensions — Total depth (D), width (W), and height (H) or diameter (Dia) and length (L) of a plug, a receptacle, or transition parts. Dimensions include those of mounting, latching, and safety devices.

Plug — Part of a connector. Usually it is the inserted (movable) half of the connector.

Receptacle — Part of a connector. Usually it is the stationary half of the connector (fixed to an equipment box or an electrical component) and has mounting provisions.

Resistance for Mated Connector — Overall resistance of the mated wired connector, as defined by MIL-C-55544 paragraph 4.5.13.

Ribbon Cable — Cable in a flat configuration and containing round wires.

T × W — Thickness and Width. Dimensions of a flat conductor.

Transition — Fixed connection of FCC to round wire, printed circuit board, box, or electrical component. Connection is permanent or disassembled only with difficulty.

SECTION I. INTRODUCTION

Background

Although the benefits of using flat conductor cable (FCC) systems have been demonstrated repeatedly, application has been limited, partially because of a lack of awareness of available connecting and terminating devices. By using the proper interconnecting hardware, the economy of FCC systems can be improved greatly.

During the period of August 1970 to December 1970, a NASA-sponsored survey was conducted with the specific intent of locating current and potential sources of FCC connecting and terminating devices within Government and industry, obtaining data on available items and those in development and compiling the material into a design handbook.

Handbook Description

This design handbook is concerned solely with FCC connecting and terminating hardware. Although various special connecting and terminating techniques have been developed by industry, these are not within the scope of the document unless hardware for performing the technique is being marketed or is ready for marketing.¹

The handbook is intended to be of use to managers, engineers, designers, procurement specialists, and other interested personnel. The format is designed so that coverage by item and producer will be comprehensive enough to enable an individual to select items which will meet his requirements. Then, more detailed information (including prices) can be obtained directly from the manufacturer.

With the exception of minor editing, all data have been included as received. No attempt has been made to validate material accuracy or to endorse any one manufacturer of FCC hardware. No attempt has been made to judge the quality or suitability of any item manufactured by any company for

1. Companies which have developed techniques for connecting FCC include McDonnell Douglas Corporation of Huntington Beach, California, and Components Corporation of Denville, New Jersey.

and particular use. These aspects are left to the discretion of the user. Information is valid only as of this report's date of publication. Prior to making final component selection, the purchaser should contact the manufacturer for information concerning any part modifications and to assure that all data are as indicated.

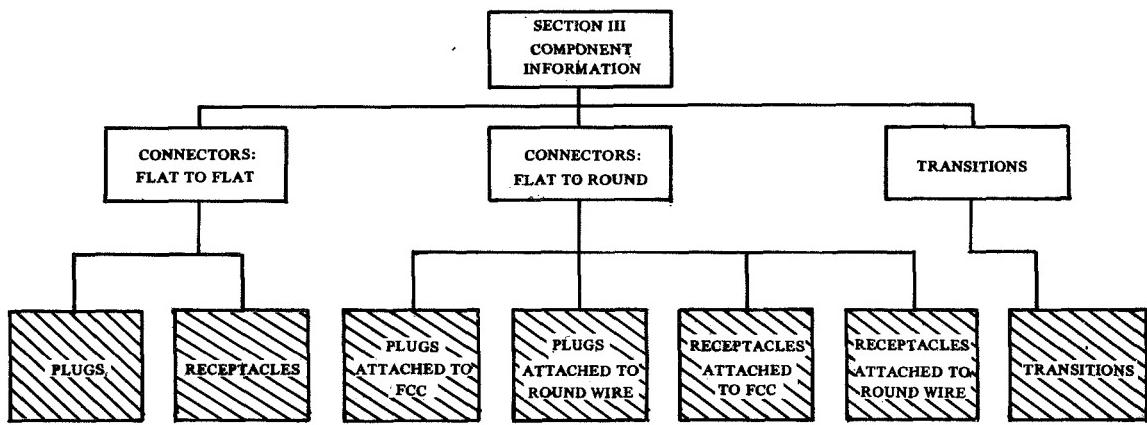

Data have been grouped in three sections: Section II, Component Availability and Location; Section III, Component Information; and Section IV, Manufacturers' Data.

Section II. Component Availability and Location consists of two types of charts: (1) Component Availability by Contact Number and Manufacturer and (2) Index to Parts and Manufacturers. The former enables the reader to immediately determine which companies manufacture, or are developing, parts containing the required number of contacts and cable layers. At this stage, the reader can directly contact the producer for information or can turn to the second type chart, Index to Parts and Manufacturers, which provides page numbers within the handbook where data can be obtained, either by company or component.

Section III. Component Information consists of standardized data sheets containing material compiled from questionnaires. This section has been subdivided into three major areas according to type connector or transition:

1. Connectors: Flat to Flat
(Separable plugs and receptacles for FCC to FCC, FCC to flexible circuit, or FCC to printed circuit board connections).
2. Connectors: Flat to Round
(Separable plugs and receptacles for FCC to round wire connections).
3. Transitions
(Fixed and semipermanent connections of FCC to round wire, printed circuit boards, components, etc.).

Modifications of connector or transition components which allow the part to be used for termination purposes are described under the connector or transition headings. One or more completed sets of data sheets (charts) have been prepared for each of the shaded component blocks in the following graphic breakdown of Section III. Within each chart, components are listed by company.

Section IV. Manufacturers' Data contains additional producer-supplied material (component family data sheets, photos, drawings). Material is arranged alphabetically by manufacturer.

By systematic use of the three data sections, the reader can

1. Determine availability of potentially useful components and names of producers
(Section II. Component Availability and Location)
2. Locate page numbers for applicable information within the handbook
(Section II. Component Availability and Location)
3. Compare and select potentially useful items
(Section III. Component Information)
4. Obtain additional manufacturer-supplied information for items of interest
(Section IV. Manufacturers' Data)

EXAMPLE DEMONSTRATING HANDBOOK USE

A designer needs a connector to join FCC to FCC. Additional requirements are that the connector meet the following conditions:

20	Contacts
2	Cable layers
600 V (rms)	Voltage rating
5 A	Current rating

Turn directly to . . .

1. Section II. Component Availability and Location

This section consists of two types of charts. The first, "Component Availability by Contact Number and Manufacturer" (Charts II-1 to II-3), enables the designer to quickly see if potentially useful connectors are available. Since the designer is interested in connectors for flat to flat applications, locate "Component Availability by Contact Number and Manufacturer: Connectors for Flat To Flat Connections." According to this chart, only two companies (AMP and Methode) have connectors with the required number of contacts (20) and cable layers (2).

Using Chart II-4, "Index to Parts and Manufacturers," the designer can locate page numbers for information on potentially useful items. Assume that only chart data is pertinent at this stage. Looking down the first column, "Manufacturers," locate AMP and Methode. Then read across to "Connectors: Flat to Flat." Chart data on AMP plugs and receptacles begins on pages III-1 and III-37. Chart information on Methode plugs and receptacles begins on pages III-21 and III-61. Turn to . . .

2. Section III. Component Information

One notes that the section breakdown is on the page following the section divider. Also, section parts are tabbed for added convenience.

For AMP plug information, turn to page III-1. Locate column headings of primary interest (contact number, number of cable layers, voltage rating, and current rating). No plugs in this chart meet the voltage rating requirement of 600 V (rms) and the current rating of 5 A. Turn to the next two charts for more AMP plug data. Again, the voltage and current rating requirements cannot be met. Charts with information on AMP receptacles (beginning on page III-37) indicate this same fact, none of the AMP components meet all the designer's requirements.

Methode remains as a producer of potentially useful items. Turn to page III-21 (obtained from Chart II-4, "Index to Parts and Manufacturers") for plug information. The first chart with Methode data does not describe components meeting all requirements. Only on the second chart can one find a plug (63-6220-1100) with 20 contacts, 2 cable layers, 600 V (rms) voltage rating, and a current rating of 5A which is suitable for FCC to FCC applications. For information on the mating receptacle, turn to page III-61 (again obtained from Chart II-4), beginning of Methode receptacle data.

If the reader is interested in additional manufacturer supplied data, he can locate the beginning page number in the third Section III chart column, "Manufacturer's Data," and then turn to . . .

(Continued)

Note 1: FCC plugs and receptacles with and without mounting ears are part of the AMP-INTY connector series. Refer to the last column, "Remarks," for additional information on mating possibilities.

Note 2: Mated dimensions exclude locking mounting screws and spring clip series. Refer to the last column, "Remarks," for additional information.

Note 3: Round wire 24-22 AWG may be used.
Note 4: Weights are approximate.

While many are able to make a living in the field of science, others are not.

CHART III - 1. CONNECTORS: FLAT TO FLAT, PLUGS

PHYSICAL DATA: CONTACTS

Note 4: Round wire 24-30 AWG can be used.

Note 5: For each group of three contact numbers, 0.050 is the center-to-center contact spacing for the maximum contact number, 0.100 for the minimum.

Note 1: The asterisks within part numbers indicate variable characteristics. See Section IV, "Manufacturers' Data," for an explanation of part nomenclature. For information on additional mating possibilities, refer to the last chart column, "Remarks."

Note 2: Refer to the last column, "Remarks," for additional mating possibilities.

Note 3: A molded-on plug, NASA-MSFC number 50M72604, is available which differs from plug number 50M72637 primarily in the lower operating temperature characteristics. Also, special molding equipment is required for plug assembly. Refer to Section IV, "Manufacturers' Data," for more information.

Note 4: The mated connector assembly consists of one receptacle and two plugs for feedthrough and adapter usage.

Note 5: Maximum dimensions are given.

Crimping Machine #683790-2, Extraction Tools For Contacts #91048	None Required	None Required	None Required	For All Series; Military Uses, Computers And Related Equip- ment, Consumer Products	Stock	IPC-FC-218	Type Flat To Flat Connections: FCC To FCC, Flexible Circuit, PC Board, And Aluminum Panel. Receptacles can also be used for flat to round and round to round connections. Refer to "Connectors: Flat To Round." For all receptacles with and without mounting ears, round wire and FCC can be intermixed in any housing. Flexible circuits can be crimp terminated with the receptacles provided the termination pads are made to AMP specifications. FCC contacts can be crimped anywhere on a cable to allow daisy chain- ing. FCC must conform to IPC-FC-220, Tol. Class IV. Insulation material must be poly- ester or polyimide. Receptacles will mate with AMPMODU Mod. II. 0.025x0.025 posts for PC board applications.

Note 1: These FCC plugs and receptacles are in development. The in-house name applied to them, as well as to developmental FCC transitions, is "Universal Connectors."

Note 2: In process testing.

Note 3: Round wire 32, 30, and 26 AWG can also be used in place of the flat conductor sizes 0.002x0.025, 0.003x0.026, and 0.003x0.062.

Note 4: The asterisks within part numbers indicate variable characteristics. A complete part number explanation can be found in the section entitled "Manufacturers' Data." For information on additional mating possibilities, refer to the last column, "Remarks."

Note 5: Depth Measurements are maximum.

Note 6: Number of contacts by cable layer.

Note 7: Round wire 24-30 AWG can be used.

Note 1: Receptacles in the 94 series consist of two 91 series receptacles commonly mounted.

Note 2: Components can also be obtained in component and FCC assemblies to meet standard and special requirements.

Note 3: The asterisks within part numbers indicate variable characteristics. See "Manufacturers' Data" for an explanation of part nomenclature. For information on additional mating possibilities, refer to the last chart column, "Remarks."

Series FC* 4 can be located in Section IV, "Manufacturers' Data."

The removable wafer concept allows intermixing of round wire and FCC. Thus, flat to flat, flat to round, and round to round connections are possible with the plug.

Refer to "Connectors: Flat To Flat" for complete part descriptions. Dimensions

on the round backshell receptacle series

are noted in Section IV,

Refer to "Connectors: Flat To Flat, Plugs" for complete part descriptions. Only differences occurring when plugs (attached to FCC) are mated for flat to round connections are noted here.

Components in the "Fleximate" connector series are intermountable and intermateable with all plastic and metal types in the round wire "Micromate" connector series. Within the "Fleximate" series, plugs and receptacles mate for flat cable to flat cable connections. For plug information, refer to "Connectors: Flat To Flat, Plugs."

Refer to "Connectors: Flat To Flat, Plugs." Only differences occurring when plugs (attached to FCC) are mated for flat to round connections are noted in this chart.

This connector series has been designed for FCC to FCC, FCC to PC board, and FCC to round wire connections. For available information on the series in general, refer to charts entitled "Connectors: Flat To Flat, Plugs."

FCC or round wire can be used in members of the Universal series. Therefore, flat to flat, flat to round, and round to round connections are possible. For complete part descriptions, refer to charts entitled "Connectors: Flat To Flat."

The removable wafer concept allows intermixing of round wire and FCC. Thus, flat to flat, flat to round, and round to round connections are possible with this receptacle. Refer to charts entitled "Connectors: Flat To Flat" for complete part descriptions. Dimensions on the round backshell plug series FC*2 can be located in Section IV, "Manufacturers' Data."

The removable wafer concept allows intermixing of round wire and FCC. Thus, flat to flat, flat to round, and round to round connections are possible with this receptacle. Refer to charts entitled "Connectors: Flat To Flat" for complete part descriptions. Dimensions on the round backshell plug series FC*2 can be located in Section IV, "Manufacturers' Data."

Note 1: These transitions are in development. The in-house name applied to them as well as developmental FCC plugs and receptacles is "Universal Connectors."
Note 2: In process testing.
Note 3: Refer to last column, "Remarks," for type transitions. Item is also used as an FCC termination.

Note 4: The height was measured with wire wrap pins. If quick-disconnect terminals are used instead, the height will be 0.84. If solder dip pins are used, the height will be 0.70.

AMP-UNYT
Flexible Flat
Cable Connector

Complementing AMP's complete line of Flexible Flat Cable Connectors is the AMP-O-MATIC* Flexible Flat Cable Terminating Machine — the industry's first fully automatic machine for the termination of flexible flat cable. Offering speed and economy, this versatile machine completely eliminates the need for expensive and time consuming special cable preparations. Reel-fed, stamped and formed contacts are automatically applied to the flat cable at rates of two contacts per second in one continuous action. The operator simply positions the cable and presses the start button. The machine automatically displaces the insulation, crimps the contact to the cable and makes positive contact to the conductor with excellent electrical and mechanical characteristics.

Flexible Flat Cable Connectors

AMP continues to expand its industry use — proven crimp termination technology by providing the first automatic machine crimp application for flexible flat cable. The AMP-UNYT Flexible Flat Cable Connector combines the industry demand features of functional application and applied cost savings.

This technique eliminates the need for special and costly cable preparation, stripping and conductor plating. It also removes the inherent dangers of heat damage from solder or weld techniques.

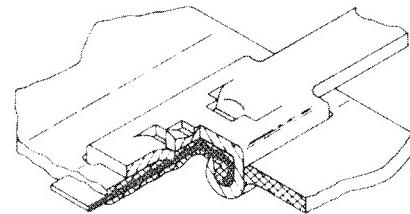

Basically, the AMP crimp termination technique uses stamped and formed contacts which are automatically crimped onto the cable conductor. During the crimping process the contact penetrates the insulation on both sides of the conductor, and then is folded over to grip and force the insulated conductor into the wire barrel area of the contact. At this point in the application the insulation is displaced from the conductor and positive contact is made with the flat conductor. This results in a termination with excellent electrical and mechanical characteristics.

The .025 x .025 pin contact and mating receptacles are available with gold over nickel plating and accept cable with .060"/.065" wide conductors on .100" centers per NAS729, IPC-FC-220 and MIL-C-55543. Solder tab contacts for making permanent solder terminations to printed circuit boards are available in either gold over nickel plating or tin plating.

The AMP-UNYT Flexible Flat Cable Connector is available in 9, 19, 29, 33 and 38 positions, male and female, with or without mounting ears.

This versatile connector mates with a number of A-MP* Connectors including AMPMODU* Connectors.

The AMP-O-MATIC Automatic Flexible Flat Cable Terminating Machine applies contacts to the cable in one continuous action. The operator simply positions the cable in the alignment fixture, which is part of the machine, and then presses the start button. Speed of application and the reliability of the terminations provide you with overall applied cost savings.

Illustrated, above, is a cross sectional view of the AMP-UNYT flexible flat cable contact showing the high performance insulation displacing technique. This termination is accomplished by the legs on the contact penetrating the insulation on both sides of the conductor and folding over to grip and force the insulated conductor up into the wire barrel where the insulation displacing lances make positive contact with the conductor.

Contact Specifications

Electrical Characteristics:

- Contact Current Rating:
3 amperes continuous

- Operating Temperature:
-65°C to +125°C

Performance:

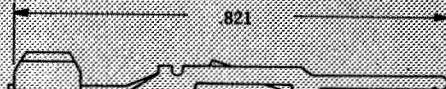

- High Potential: 1,200 VAC RMS
- Insulation Resistance: 5,000 megohms minimum between contacts

All Dimensions in Inches

Features

- Automatic crimp on, snap-in contacts.
- Crimp technique displaces insulation for excellent electrical contact.
- Reliable electrical and mechanical characteristics.
- Eliminates cable stripping and conductor plating requirements.
- No heat applied to crimp-type contacts.
- Easy connector maintenance.
- Choice of pin contacts, receptacles or printed circuit board solder tabs.
- Capability of intermixing flat cable and round wire conductors in the same housing.
- Choice of 9, 19, 29, 33 and 38 position housings.
- Terminates conductors on .100" centers with .060"/.065" wide conductors per NAS-729, IPC-FC-220 and MIL-C-55543.
- Connectors available for cable to cable, cable to board, cable to .025 x .025 AMPMODU posts, daisy chain, and cable to wire applications.
- Automatic machine crimp on contact applications for lower applied cost.
- Solder tab contacts for permanent printed circuit board terminations are available. Choice of gold over nickel or tin plating.

Pin
Contacts

For Flexible Flat Conductor Cable Terminations

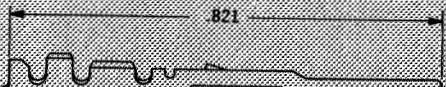

(.060"/.065" wide conductors on .100" min. centers,
.015" max. total cable thickness)

Material: Phosphor Bronze

Part Nos.: 86556-4*

86556-6**

NOTE: All contacts are in strip form for recommended
AMP-O-MATIC flexible flat cable machine application.

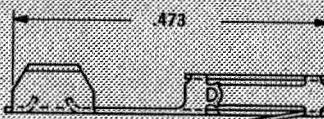

For 24-22 AWG Wire Size Terminations

(.040"-.056" dia. insulation range)

FLEXIBLE FLAT CABLE APPLICATIONS

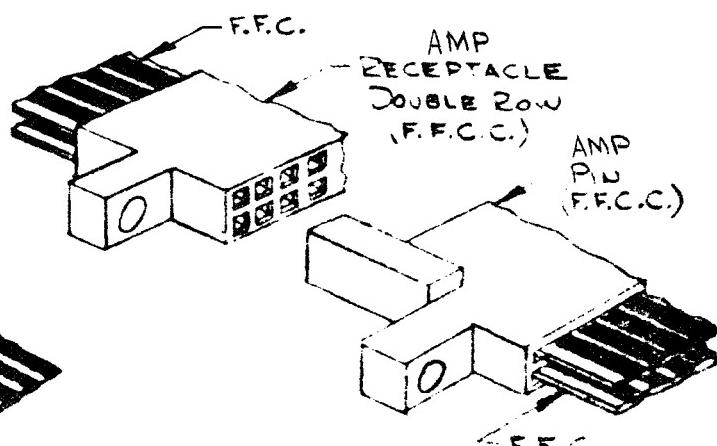

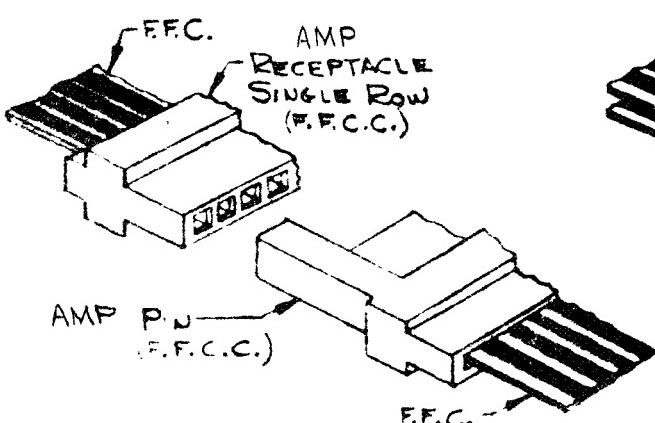

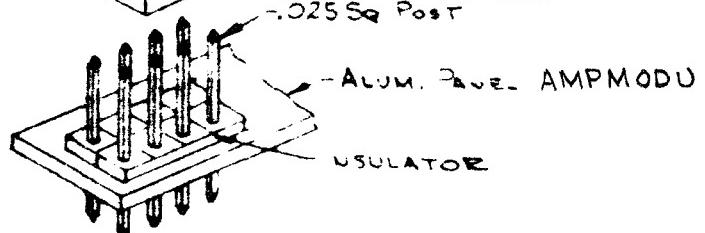

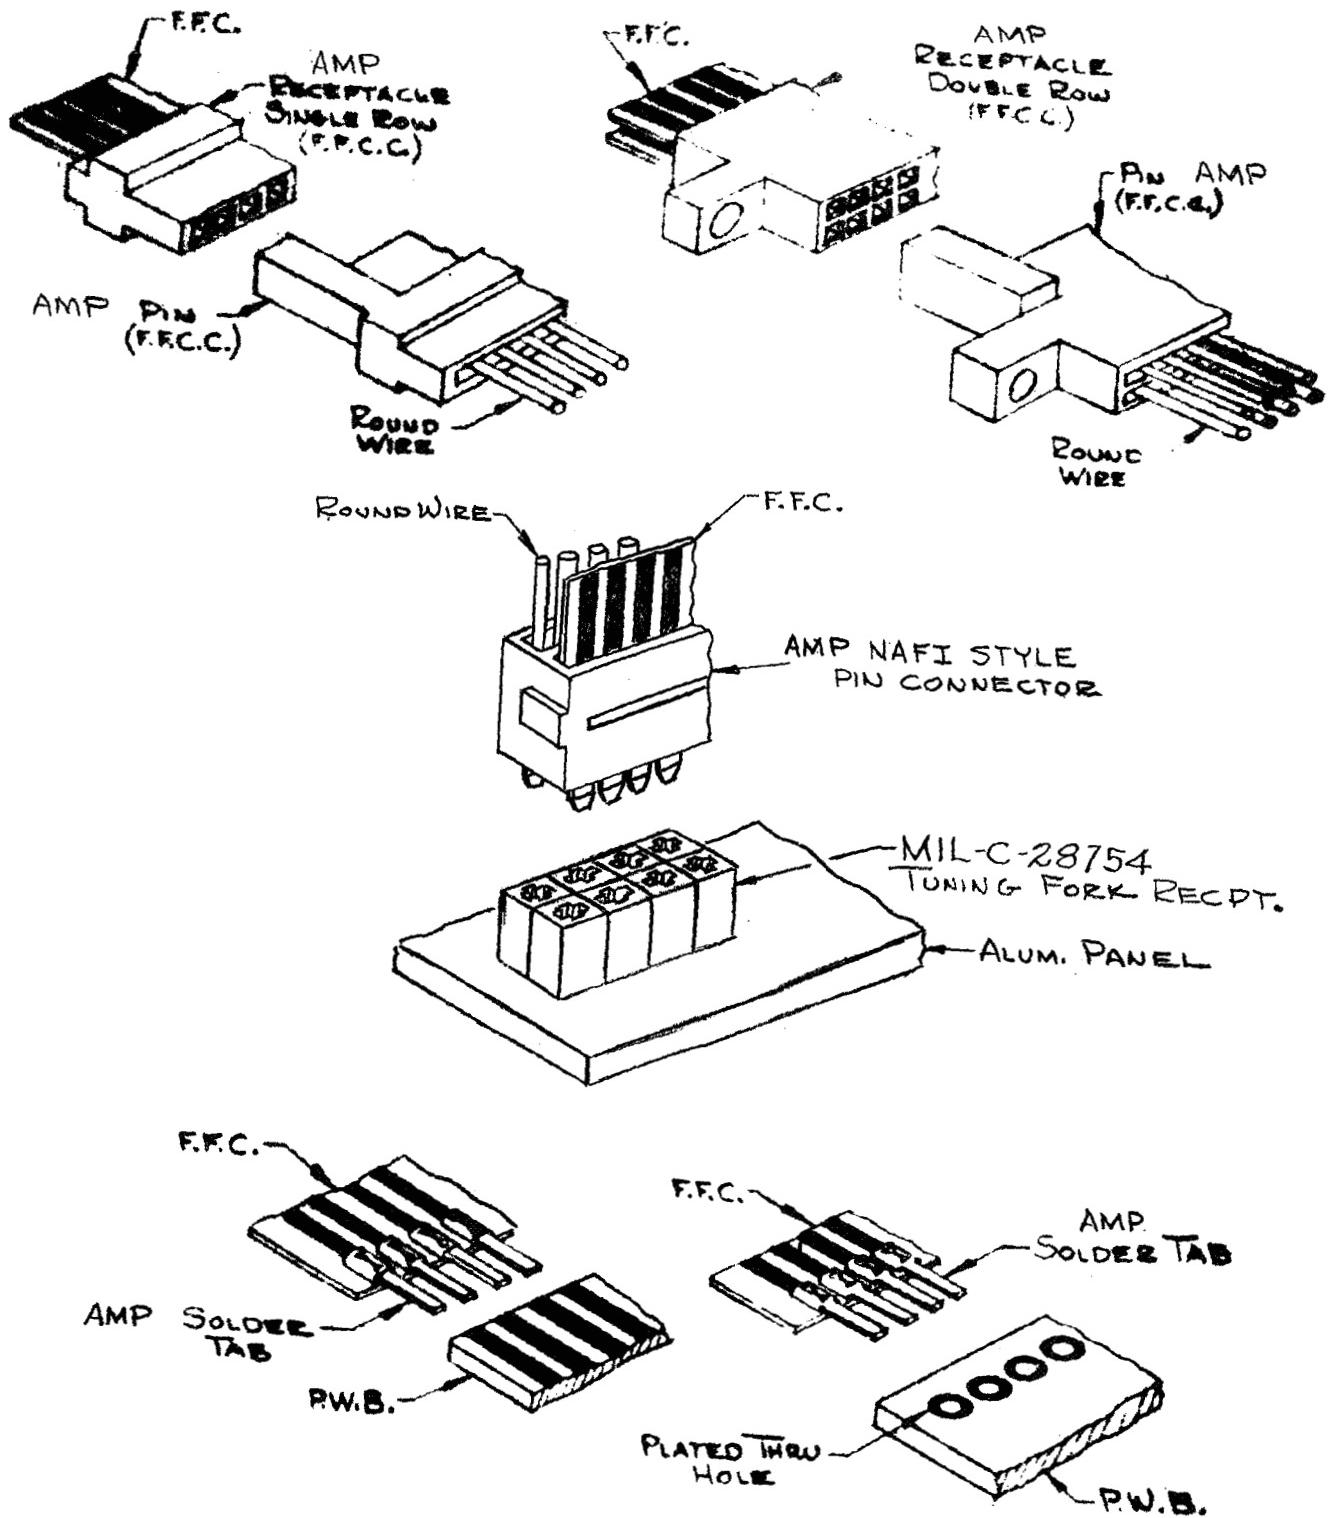

P.W.B.

AMPMODU MOD II
DOUBLE ROW CONNECTOR

AMPMODU MOD II .025 Sq Post

PRODUCT SPECIFICATION FLEXIBLE FLAT CABLE CONNECTOR

1. SCOPE:

This specification establishes the physical and performance requirements for the FLEXIBLE FLAT CABLE CONNECTOR and describes the testing and quality assurance provisions applicable to product manufactured to this specification.

Product Configuration – The connectors covered by this specification are of two basic types described below.

TYPE I - Flat cable to flat cable utilizing crimp type contacts, box shaped pin and sockets, retained in molded plastic housings.

TYPE II - Flat cable to printed-wiring boards - utilizing crimp-snap in receptacle or pins on the tape cable and AMP MODU MOD II receptacles or posts mounted to the printed wiring board

2. REFERENCE DOCUMENTS:

The following documents form a part of this specification to the extent referenced herein:

2.1 MILITARY AND FEDERAL SPECIFICATIONS -

MIL-M-14F	Molding Material Thermo Setting
MIL-I-45208	Inspection System Requirements
MIL-P-46120	Plastic Molding and Extrusion Material, Polysulfone
MIL-G-45204	Gold Plating; Electrodeposited
MIL-W-16878	Wire, Electrical, Insulated, Copper
QQ-B-750	Phosphor Bronze
QQ-N-290	Nickel Plating; Electrodeposited

2.2 AMP SPECIFICATIONS -

109-1 Definitions of Terms and Methods used in AMP
Test Specifications

109-3 Millivolt Drop Method for Measuring Resistance

2.3 MILITARY STANDARDS

MIL-STD-202 **Test Methods for Electronic and Electrical Component Parts**

NAS 729Phosphor Bronze
Cable, Electrical, Flat Conductor, Flexible

3. DESIGN REQUIREMENT:

3.1 PHYSICAL CHARACTERISTICS AND MATERIAL - The dimensions of all components that are parts of the connector assembly shall meet the requirements contained on the applicable drawings. Materials and finishes used shall be as specified in the following paragraphs. Substitute materials and finishes may be authorized only after the performance of the substitute has been demonstrated and shall be capable of meeting the requirements of this specification.

3.1.1 HOUSINGS - The housings shall be fabricated from Polysulfone or Diallyl Phalate material conforming to MIL-P-46120 or MIL-M-14-F-SDGF.

3.1.2 CONTACTS - The contacts shall be fabricated from phosphor bronze conforming to QQ-B-750.

3.1.3 CONTACT PLATING - The contacts shall be plated gold over nickel to the thickness specified on the applicable drawing. The gold plating shall conform to MIL-G-45204 and nickel plating to QQ-N-290.

3.2 PERFORMANCE AND ENVIRONMENTAL RATINGS - The flexible flat cable connector shall meet the following ratings when exposed to environmental stress of this specification.

3.2.1 Temperature- Current -Rating - The connectors are rated for continuous operation at an upper temperature limit of +85°C and a lower temperature limit of -55°C. Ambient temperature conditions and current loading of contacts shall be considered in determining whether these limits are exceeded. Typical Temperature rise characteristics; at an ambient temperature of

NAME	PRODUCT SPECIFICATION FLEXIBLE FLAT CABLE CONNECTOR		

25.6°C a current of 3 amperes through all contacts of a 19 position plug mated with a AMPMODU MOD II receptacle creates a connector assembly housing temperature of 65°C.

- 3.2.2 CURRENT RATING - 3 Amperes.
- 3.2.3 INSULATION RESISTANCE - Greater than 1,000 megohms.
- 3.2.4 TERMINATION RESISTANCE - 25 Milliohms - maximum.
- 3.2.5 INDIVIDUAL CONTACT RETENTION - 10 Pounds - minimum.
- 3.2.6 TOTAL MATING FORCE PER CONTACT - 5.0 ounces maximum.
- 3.2.7 SEPARATION FORCE PER CONTACT - .75 ounce minimum.
- 3.2.8 DIELECTRIC STRENGTH (SEA LEVEL) - 1200 VAC (Test Voltage).
- 3.2.9 DURABILITY- 500 Cycles (Gold).
- 3.2.10 MAINTENANCE AGING - 10 Contact Insertion-Extractions.
- 3.2.11 THERMAL SHOCK - MIL-STD-202, Method 107, Condition A -55° - +85°C.
- 3.2.12 VIBRATION - MIL-STD-202, Method 201 (10-55 CPS).
- 3.2.13 PHYSICAL SHOCK - MIL-STD-202, Method 205, Condition B (30 G)
- 3.2.14 MOISTURE RESISTANCE - MIL-STD-202, Method 106 (Delete Step 7b)
- 3.2.15 SALT SPRAY - MIL-STD-202, Method 101, Condition 48 hr @20%.

4. TEST REQUIREMENTS AND METHODS:

- 4.1 TEST ENVIRONMENTS AND CONDITIONS - Unless specifically stated, tests and examinations required by this specification shall be conducted under any combination of conditions within the following ranges:

SHEET	AMP		AMP INCORPORATED HARRISBURG, PENNA.
3 OF 16	Loc	A	NO. 108-9,024
NAME		PRODUCT SPECIFICATION FLEXIBLE FLAT CABLE CONNECTOR	
		REV A	

Temperature: 20° to 30°C
Relative Humidity: 30 to 80 percent
Barometric Pressure: 24 to 31 inches of mercury

- 4.2 TEST MEASUREMENTS - Whenever possible, all testing shall be conducted in a manner which yields variables data. Unless otherwise specified, a minimum of 30 random measurements shall be recorded.
- 4.3 EXAMINATION OF PRODUCT - Before, during and after testing the test operator shall visually examine hardware, to note and record original and changed characteristics with respect to; surface finish, texture, or cracks, etc. Changes in physical characteristics beyond drawing and/or specification allowances shall be considered a test failure.
- 4.4 TOTAL MATING FORCE - When tested in accordance with Paragraph 4.4.1, the mating force per contact shall not exceed 5.0 ounces.
- 4.4.1 TOTAL MATING FORCE - The force to mate the connector halves shall be measured and recorded. The force shall be determined by dividing the total mating force by the number of loaded contact positions. The measured values shall meet the requirements of Paragraph 4.4.
- 4.5 TERMINATION RESISTANCE (LOW LEVEL) - When tested in accordance with Paragraph 4.5.1, the resistance of mated pairs of contacts shall not exceed 25 milliohms.
- 4.5.1 TERMINATION RESISTANCE (LOW LEVEL) - The resistance of individual mated pairs of contacts shall be measured as shown in Figure 2 in accordance with AMP Test Specification 109-3. The test current shall not exceed 1.0 millamps D.C. and the open circuit voltage shall not exceed 20 millivolts. The measurements shall meet the requirements of Paragraph 4.5.
- 4.6 TERMINATION RESISTANCE (RATED CURRENT) - When tested in accordance with Paragraph 4.6.1, the resistance of mated pairs of contacts shall not exceed 25 milliohms.
- 4.6.1 TERMINATION RESISTANCE (RATED CURRENT) - The resistance of individual mated pairs of contacts shall be measured between the points shown in Figure 2 in accordance with Method 307 of MIL-STD-202. Each mated pair of contacts shall be energized

			108-9,024	A
NAME PRODUCT SPECIFICATION FLEXIBLE FLAT CABLE CONNECTOR				

separately with 3 amperes (A.C.). Measurements shall be taken after the temperature of the contacts has stabilized and shall meet the requirements of Paragraph 4.6.

- 4.7 CONTACT SEPARATION FORCE - When tested in accordance with Paragraph 4.7.1, the separation force per contact shall not be less than 0.75 ounces.

4.7.1 CONTACT SEPARATOR FORCE - The force to unmate the gauge pin shown in Figure 3 shall be measured and recorded. The measured force per contact shall meet the requirements of Paragraph 4.7.

- 4.8 INSULATION RESISTANCE - When tested in accordance with Paragraph 4.8.1, the insulation resistance shall not be less than 5,000 megohms and after environmental exposure shall not be less than 1,000 megohms.

4.8.1 INSULATION RESISTANCE - The unmated flat cable plug connector shall be tested in accordance with Method 302, Test Condition B of MIL-STD-202. The measurements shall be made between random adjacent pairs of contacts and the measurements shall meet the requirements of Paragraph 4.8.

- 4.9 DIELECTRIC STRENGTH - When tested in accordance with Paragraph 4.9.1, the flat cable plug connectors shall show no evidence of breakdown or flashover when the voltages specified in Table 1 are applied.

4.9.1 DIELECTRIC STRENGTH - The unmated flat connector halves shall be tested in accordance with Method 301 of MIL-STD-202 at the voltages and simulated altitudes shown in Table 1. The voltages shall be applied between all adjacent contacts at a rate not exceeding 500 volts per second until the applicable voltage of Table 1 is reached. The specified voltage shall be maintained for one minute. (See 4.9)

- 4.10 MAINTENANCE AGING - When tested in accordance with Paragraph 4.10.1, the contacts shall withstand a 10 pound axial load.
- 4.10.1 MAINTENANCE AGING - The crimped contacts shall be inserted and extracted thru ten (10) insertions, after the tenth insertion the contacts shall then be subjected to an axial load of ten pounds applied to the contact in a direction opposite that of insertion without dislodging per paragraph 4.10.
- 4.11 THERMAL SHOCK - When tested in accordance with Paragraph 4.11.1, there shall be no evidence of physical damage and connector shall be capable of meeting subsequent tests in Table II.
- 4.11.1 THERMAL SHOCK - The mated assemblies shall be subjected to temperature cycling in accordance with Method 107, Condition A of MIL-STD-202. The assemblies shall meet the requirements of Paragraph 4.11.
- 4.12 DURABILITY - When tested in accordance with Paragraph 4.12.1, the assemblies shall show no evidence of mechanical damage and shall be capable of meeting subsequent tests in Table II.
- 4.12.1 DURABILITY - The assemblies shall be subjected to 500 cycles of mating and unmating at a rate not exceeding 500 cycles per hour. The cycling shall be conducted in a manner which simulates service. After cycling, the assemblies shall meet the requirements of Paragraph 4.12.
- 4.13 VIBRATION - When tested in accordance with Paragraph 4.13.1 the assemblies shall show no evidence of cracking, breaking, loosening of parts, nor loss of continuity of any contact circuit greater than one microsecond.
- 4.13.1 VIBRATION - The mated assemblies shall be tested in accordance with Method 201 of MIL-STD-202. The assemblies shall be rigidly attached to the vibration fixture. The cable shall be secured to the vibration fixture as shown in Figure 4 or 5. All contacts shall be series wires and connected to a suitable testing

circuit with 0.1 ampere flowing through the contacts.
The assemblies shall meet the requirements of Paragraph 4.13.

4.14 SHOCK - When tested in accordance with Paragraph 4.14.1, the assemblies shall show no evidence of cracking, breaking, loosening of parts, nor loss of continuity of any contact circuit greater than one microsecond.

4.14.1 SHOCK - The mated assemblies shall be tested in accordance with Method 205, Condition B of MIL-STD-202. All contacts shall be series wired and connected to a suitable testing circuit with 0.1 ampere flowing through the contacts. The shock test shall be repeated 3 times in both directions of the referenced 90° axis planes (a total of 18 drops). The assemblies shall meet the requirements of Paragraph 4.14.

4.15 MOISTURE RESISTANCE - When tested in accordance with Paragraph 4.15.1, the assemblies shall meet the subsequent tests of Table II.

4.15.1 MOISTURE RESISTANCE - The unmated assemblies shall be tested in accordance with Method 106 of MIL-STD-202, except that Step 7b is not required. Following exposure, the assemblies shall meet the requirements of Paragraph 4.15.

4.16 SALT SPRAY - When tested in accordance with Paragraph 4.16.1, the assemblies shall meet the subsequent tests of Table II.

4.16.1 SALT SPRAY - The unmated assemblies shall be subjected to the salt spray test in accordance with Method 101, Condition B, 20% of salt solution shall be used, of MIL-STD-202. Following the cleaning operation at the end of the exposure period, the assemblies shall be dried in a circulating air oven for a maximum of 12 hours at $38^\circ \pm 3^\circ\text{C}$. The mated assemblies shall meet the requirements of Paragraph 4.16.

4.17 TEMPERATURE LIFE - When tested in accordance with Paragraph 4.17.1, the mated assemblies shall meet the requirements of Paragraph 4.8 and subsequent tests of Table II.

4.17.1 TEMPERATURE LIFE - The mated assemblies shall be tested in accordance with Method 108, Condition B of MIL-STD-202, at a temperature of $85 \pm 2^\circ\text{C}$. When the assemblies have returned to room temperature they shall meet the requirements of Paragraph 4.17.

PRODUCT SPECIFICATION FLEXIBLE FLAT CABLE CONNECTOR				

4.18 CONTACT RETENTION - When tested in accordance with Paragraph 4.18.1, the contact retention shall not be less than 10 pounds.

4.18.1 CONTACT RETENTION - The force to dislodge the contacts shall be measured and recorded. The load shall be applied to the contacts from the mating face at approximately 2 pounds per second. The force value shall meet the requirements of Paragraph 4.18.

4.19 CONTACT CRIMP STRENGTH - When tested in accordance with Paragraph 4.19.1, the strength of the crimp shall not be less than the following values:

FLAT CABLE	5 Pounds
# 22 Wire	11 Pounds
# 24 Wire	7 Pounds

4.19.1 CONTACT CRIMP STRENGTH - The contacts shall be placed in a standard tensile testing machine and an axial load shall be applied at a rate of one inch per minute. The holding surface or clamps of the testing machine may be serrated to provide sufficient gripping or holding strength. The contacts shall meet the requirements of Paragraph 4.19.

5. QUALITY ASSURANCE PROVISIONS:

5.1 GENERAL REQUIREMENTS - This section of the specification defines the tests and inspections required to demonstrate the ability of the FLEXIBLE FLAT CABLE CONNECTOR product to comply with the requirements of this specification.

5.2 QUALIFICATION TEST - Product conformance shall be demonstrated by subjecting production samples to the Qualification Test Sequence shown in Table II.

5.2.1 PREPARATION OF TEST HARDWARE - The test samples which are representative of current production shall be prepared in conformance with the applicable drawings, inspection procedures, specifications, and instruction sheets. All hardware shall be identified and coded per drawing. A minimum of five each of the type connector assemblies being qualified shall be submitted for test, and the following required samples shall be represented in the test package.

The contacts used with flat cable shall be crimped on 3 foot lengths of cable conforming to NAS 729 Type A or equivalent. When qualifying Type II connectors Modu II connectors shall be attached to printed wiring boards made in accordance with Figure 1.

Component parts shall be subjected to inspection and tests to assure product conformance to Section 3 of the specification. Dimensional and visual inspections as well as mechanical and electrical tests shall be performed using both sampling and 100% inspection methods. The inspection system shall meet the requirements of MIL-I-45208. AMP, as the responsible authority shall select the sampling plan, and the acceptance quality level in order to assure the quality of the product. A 1.0% AQL shall be used for major defects and a 4.0% AQL for minor defects. A major defect is defined as a non conforming condition which degrades the performance or reliability of the product to the extent where it does not meet the requirements of Section 3. A minor defect is defined as non conforming condition which will not degrade the performance or reliability of the product to the extent where it will not meet the requirements of Section 3.

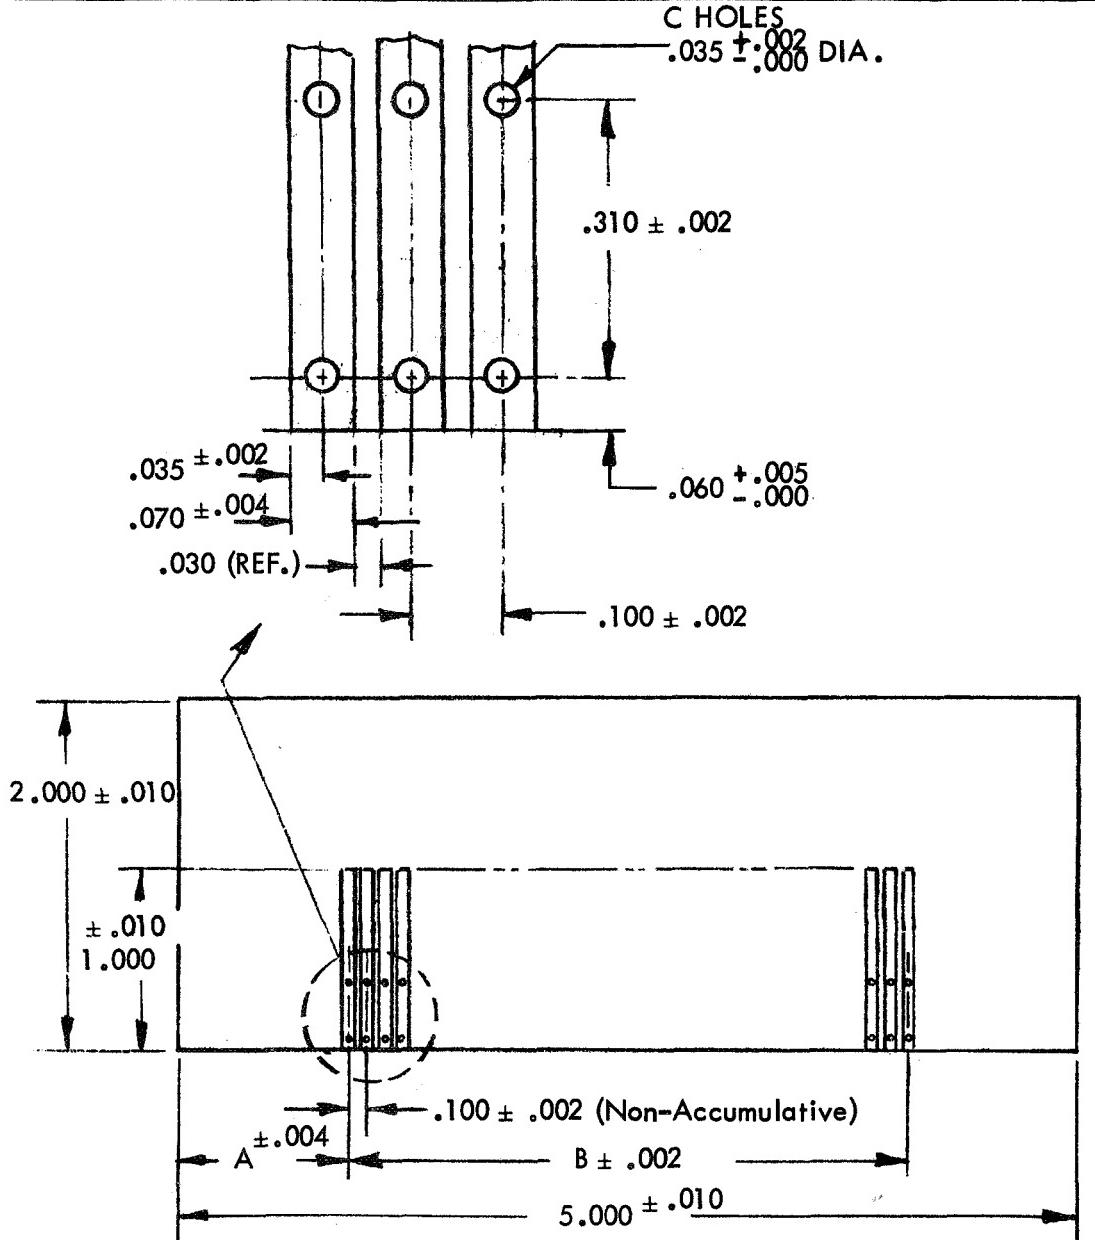

5.3 TEST DOCUMENTATION - A formal report containing all pertinent test data and analysis summaries, shall be issued at the completion of the qualification test program.

Ansley

FLAT WIRING ASSEMBLIES

Ansley

Division of Thomas & Betts Corporation

Ansley — A Total Capability

Ansley offers, from one source, the advantages of flat wiring assemblies, etched rigid and flexible circuitry, and many unique connecting methods. There need be no compromises or trade-offs. The full benefit of many technologies can be implemented either singly or in combination. The practical utilization of these Ansley capabilities is pictured and described in this brochure.

For Control Wiring

Packaging engineers have long realized that the total cost of interconnection wiring is not directly related to the price of cabling materials alone. When computing total cost all the factors must be considered; (a) labor involved in making connections and installing cable; (b) wiring errors and re-wiring; (c) investment in equipment and tools; (d) repeatable electrical characteristics and (e) long term reliability.

Ansley's application engineers work in close liaison with customer personnel to develop the least expensive, reliable, fool-proof wiring. Developments, such as Ansley "Spread-Pitch",* "Micro-Pitch"** and mass bonding,*** have not only opened new design and application possibilities for flat wiring assemblies, but have been responsible for dramatic cost savings to the user.

Eliminating Point-to-point Wiring

Conventional, time consuming point-to-point wiring is being eliminated by multi-conductor flat wiring assemblies for today's highly sophisticated circuit systems. Delivered as a package — ready to plug in — they are being used increasingly in computers, business machines, aerospace and defense equipment, communications, instruments and controls, machine tools and home appliances.

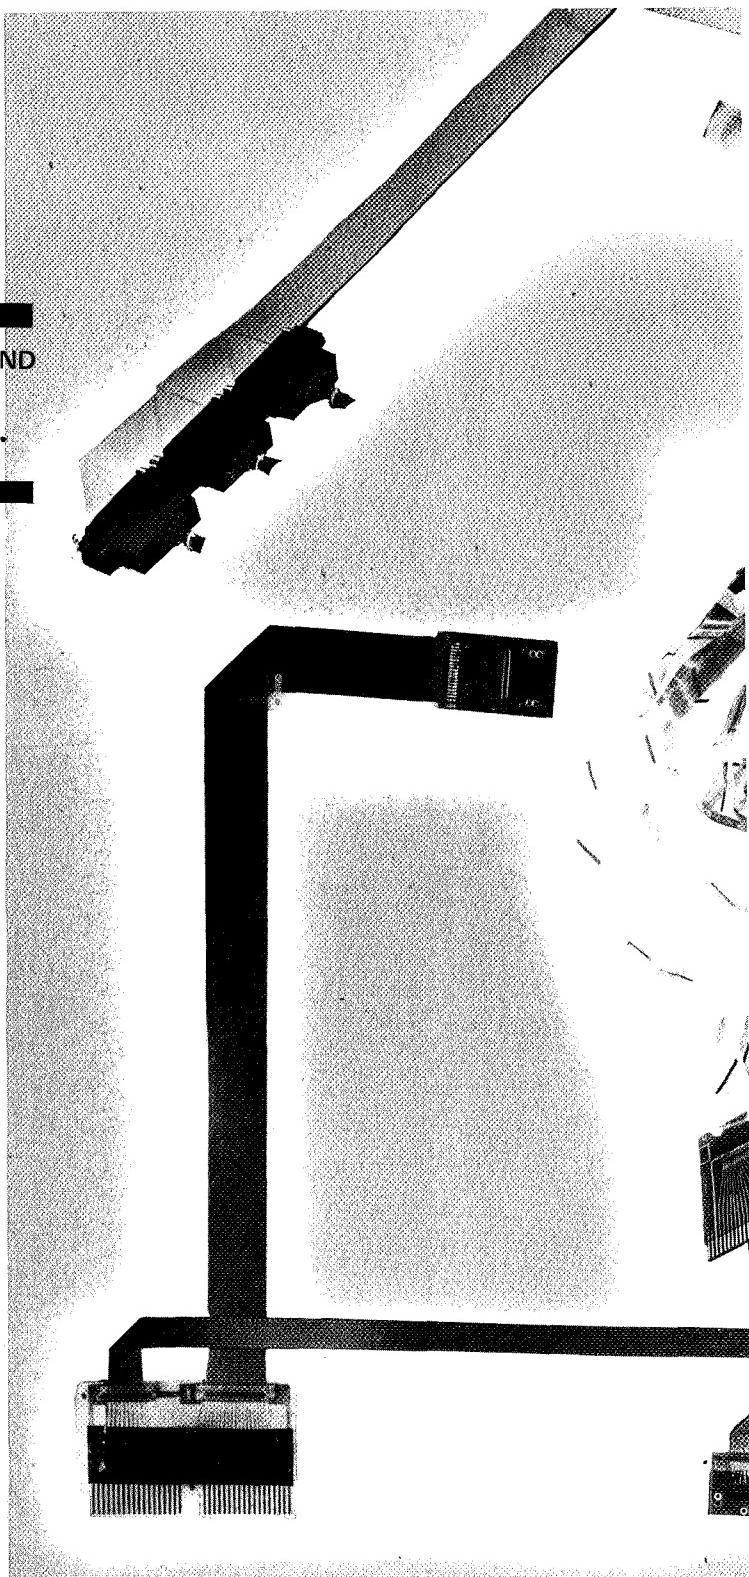

The inherent qualities of reliable flat cable assemblies to bend, flex, hinge, or be interconnection wiring that moves, are adding new dimensions to interconnection wiring that save space and weight for high density packaging.

* "Spread-Pitch" — a significant Ansley development permits universal interface by spreading conductors from the dimensions required electrically to match the optimum hardware dimensional requirements.

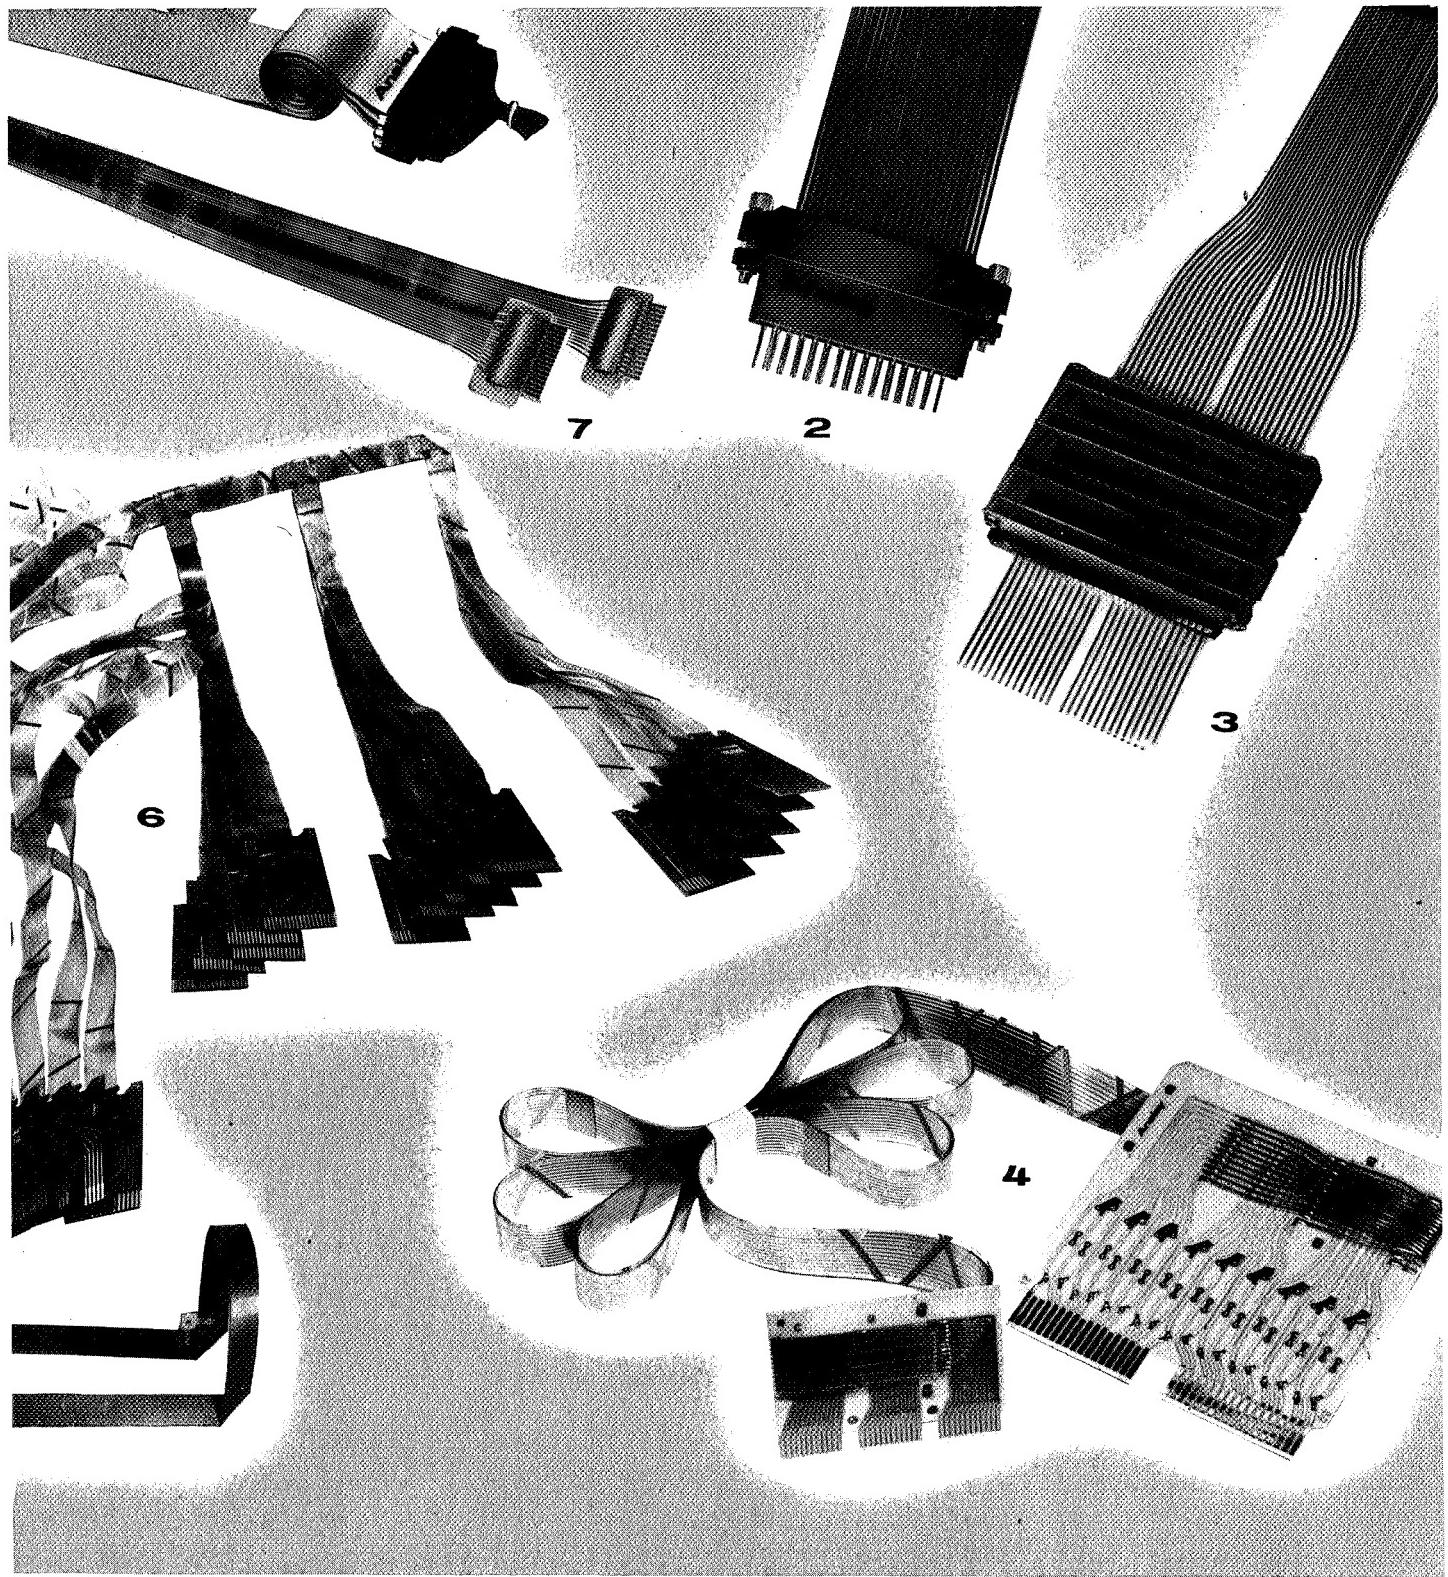

** "Micro-Pitch" — extremely close tolerance cable of very small conductors (less than 0.0005") with spacing down to 0.001".

*** Mass Bonding — developed by Ansley to interconnect multiple conductors at one time, drastically reducing cost.

COMPUTER AND COMMERCIAL ELECTRONIC WIRING

1. Triple layers of 36 conductor cable . . . round wires to triple roll-up . . . then, by slitting cable, branch circuitry from each layer back to round wire. 2. 28 conductor cable and rack and panel connector with wire wrap pins. 3. Series of Ansley printed circuit board connectors on 28 conductor cable with "Spread-Pitch" to change conductor spacing from .100" to .156" to match p.c. board. 4. Triple layered 12 conductor cable jumper, strain relieved and connected to p.c. boards mounted with signal balancing devices and components. "Spread-Pitch" from .075" to .125" pitch. Jumpers supplied 11' long. Conductors are of .035" wide

copper 2 mils thick. 5. Double side screen shielded cable terminated to p.c. boards. 24" long wide cable used "Spread-Pitch" on one end. Narrow cable 36" long. 6. Multilayered flat cable assembly standardizes all interconnection wiring. 31 conductor transmission cables, strain relieved and connected to p.c. boards, ready to plug-in. Protected with Ansley non metallic isolation material. 7. 16 conductor jumper utilizing "Spread-Pitch" from .075" to .125" pitch. Other jumpers supplied in sizes ranging from 6" to 30" long and with "Spread-Pitch" ends from .050" to .125" pitch. Positive strain relief to protect connection to board.

Ansley

Replacing Coax and Twisted Pairs For Signal Transmission

Ansley Signaflo Multiconductor Transmission Line Systems are designed to specific customer needs of:

impedance
propagation velocity

cross-talk
capacitance.

Our ability to build the controlled characteristics necessary for transmission line interconnection wiring has been the result of pioneering and continuing research in dielectric materials, conductor pitch geometry and shielding technology.

The combinations of signal transmission characteristics are limitless. Frequently systems can be designed without a ground plant...the size and type of conductors and insulation are carefully selected to satisfy all electrical and mechanical requirements. Signaflo systems often incorporate an Ansley developed non-metallic isolation material to control layer-to-layer cross-talk. If shielding is required, solid metal foil, deposited metal, wire mesh or other forms of conductive materials are selectively used on either one or two sides of the cable.

Ansley Signaflo Transmission Line Systems are being designed and used in today's high speed computers (from 5 nanoseconds down to 1 nanosecond pulse rise time). These are highly sophisticated I-O cabling systems which maintain identical electrical design characteristics within and between equipment cabinets.

Three factors of consideration for flexible wire applications are important.

1. ELECTRICAL AND MECHANICAL

Excellent dielectric properties are available in extremely thin, very flexible films with high strength, resistance to abrasion, tension, tearing and cracking. When fully annealed copper conductors or Ansley super flexible conductors are bonded between such films, flat cable with excellent electrical characteristics and an almost indestructible flexibility results.

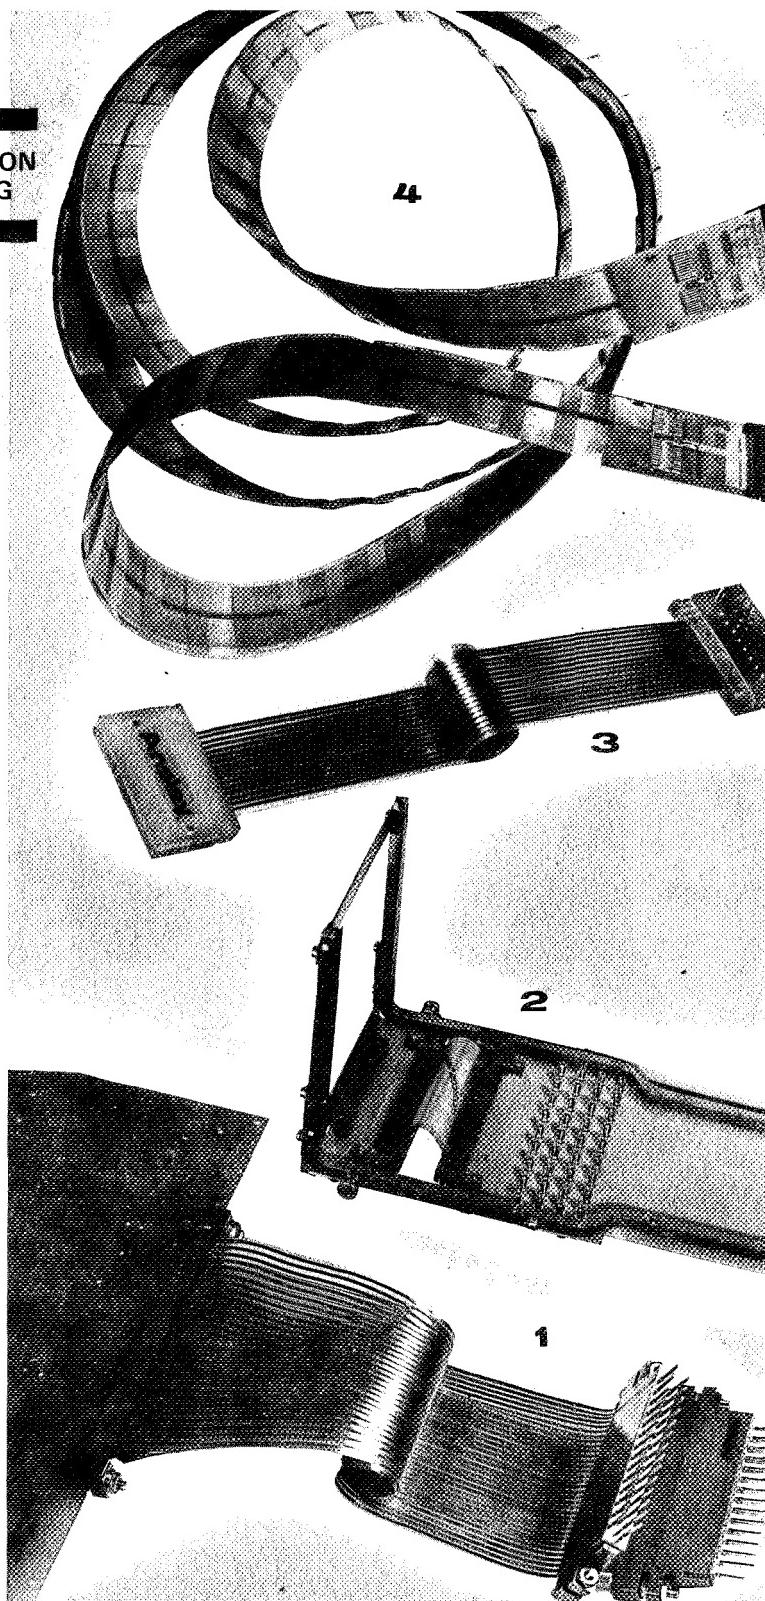

2. TYPE OF FLEXURE

Requirements for flexing vary greatly to meet each application. One application required a limp assembly which produced no measurable resistance to motion on circuitry connections to air bearing supported disc/drum memory heads. Another difficult requirement was that in which multi-million flexures were made at significant "g" loadings. Ansley flexible assemblies lend themselves to a multitude of flexure requirements not possible by other means.

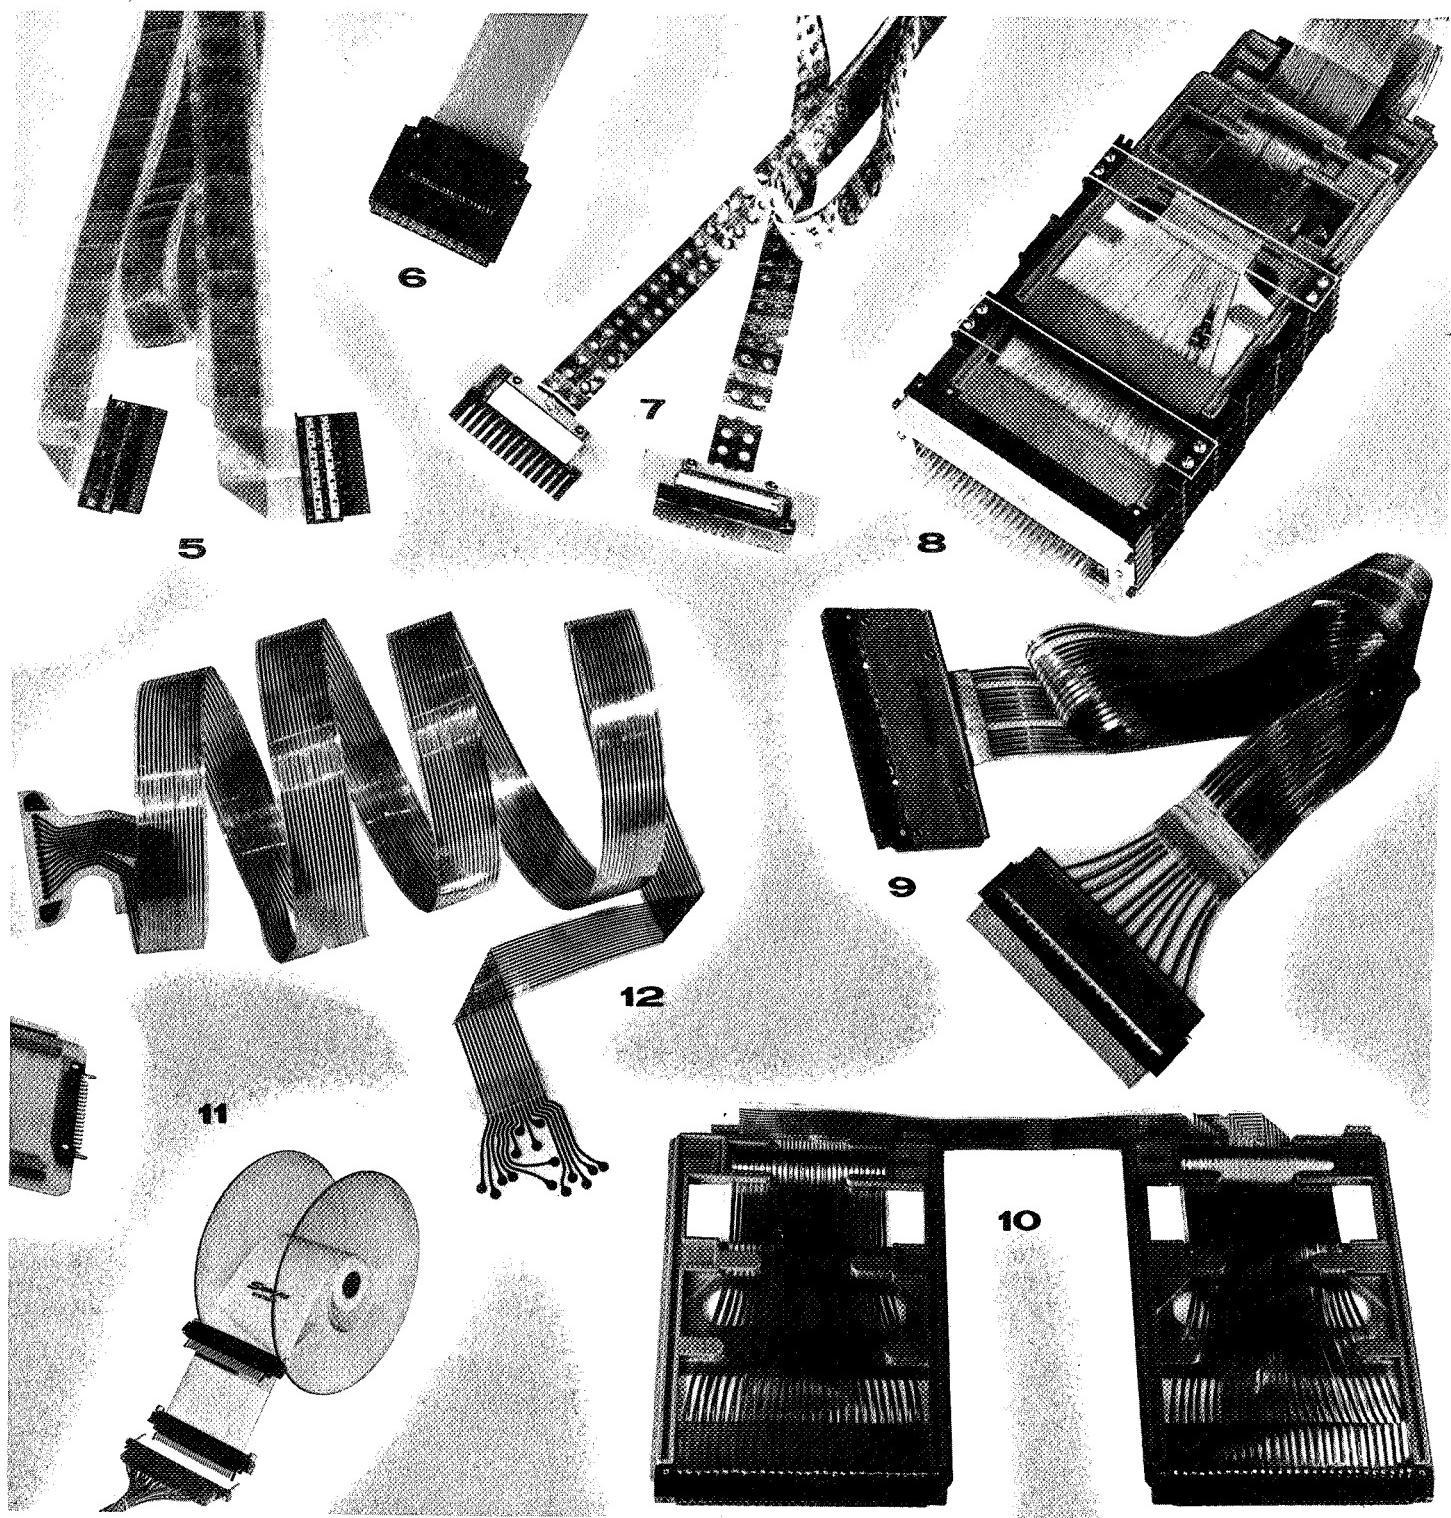

3. PACKAGING

Wherever wiring must move, hinged panels or doors, traveling heads on machinery, rotating equipment, or rack and panel wiring, Ansley flat wiring assemblies offer major advantages. Mechanical helpers such as springs, pulleys, jointed arms or other hardware can be eliminated. The configuration is dependent on packaging requirements of space, weight, travel, etc. Heat formed radii, roll-ups, lazy "S" and accordion are a few of the techniques used.

TRANSMISSION LINE WIRING

1. Ansley assembly to connect mother board to distribution area which allows board to be retractile without electrical interruption uses double layered roll-up utilizing "Spread-Pitch" cable, .100" to .156" pitch. Note conductor spacing to interface with p.c. board. Special clamps hold cable to p.c. board on one end . . . other end uses connectors fitted with wire wrap pins. 2. Assembly for p.c. card check out with 36 conductor, 2" long cable which acts as hinge for 90° movement of card holder between p.c. board connectors. 3. Miniature roll-up for 15" extension of removable chassis with special connectors to match customer hardware. 4. Signaflo transmission line system for 115 ohm controlled impedance level. Cable has signal transmission lines on either side of larger conductors which are current carrying and eliminated the need of two separate cables. 5. Signaflo transmission line system for 100 ohm, 1.45 nanosecond velocity of propagation requirement. Multi layered cable separated by a ladder type Ansley non-metallic isolation barrier which keeps the cable in place as well as

isolates the cable layers from each other or the chassis so that electrical characteristics do not change. 6. 100 ohm Signalflo transmission line system with 18 conductors. Capacitive coupling is 4% maximum between 2 adjacent signal lines with minimum cross-talk. 7. Signalflo transmission line system for 84 ohm, 1.5 nanosecond velocity of propagation requirement. aci metallic isolation barrier protects shielded cable from outside interference. 8-9-10. Various Signalflo system jumpers for card racks to replace expensive assembly. Molded card holder functions as cable holder, strain relief, two layer separation barrier and connector mount. "Spread-Pitch" cable is .075" to .150" and .100" to .400" pitch. 11. Special spool to guide extremely long extension of roll-up for machinery control application. 12. Signalflo Transmission line system to connect read-write matrix on computer. System required 93 ohm controlled level of impedance and cross-talk 25 db or better. "Spread-Pitch" in center of 4' long jumper allowed mounting support through cable. Ends of cable connected to Ansley Free-Flex flexible etched circuit.

Ansley

Division of Thomas & Betts Corporation

Today, with Interconnection and Structural Systems for Memory Devices, Ansley is the only company that produces systems to cover every requirement for new memory technologies. Ansley developments and techniques have been especially sensitive and responsive to these requirements.

Plated Wire Support Structure, Word Line and Keeper

- * As part of the I/S System for Memory Devices plated wire support structures of short or very long lengths with precision spacing and quality insulation are available in various types such as flat and contoured. The customer's plated wire is either inserted and connected or the tunnel structure left open to receive the plated wire. Single, doubles or other multiples of word lines are bonded to the tunnel structure in full turn, half turn or multiple turn configurations.
- * Planar thin film memories require close tolerance spacing for matrices to which Ansley's "Micro-Pitch" capability responds so precisely.

To tailor memory packages to specific customer requirements, Ansley memory packaging techniques also encompass close tolerance positioning of sense-digit and word-line structures and matrices for planar thin film memories.

Flux Concentrator (Keeper)

- * The inclusion of Ansley's flux concentrator or flexible "keeper" to the I/S System as an integral element offers distinct advantages to both plated wire memory plane and planar thin film memories. Adjacent bit interference is minimized with improved electrical and magnetic properties.

High Density Sense-Digit Lines

Wires smaller than 1/2 mil diameter with extreme precision sense-digit line spacing tolerances present new concepts for high speed and high density memories. Work is progressing on densities of 1000 wires per inch. Super conducting materials and Niobium for cryogenic memories are under investigation for use in I/S Systems for Memory Devices.

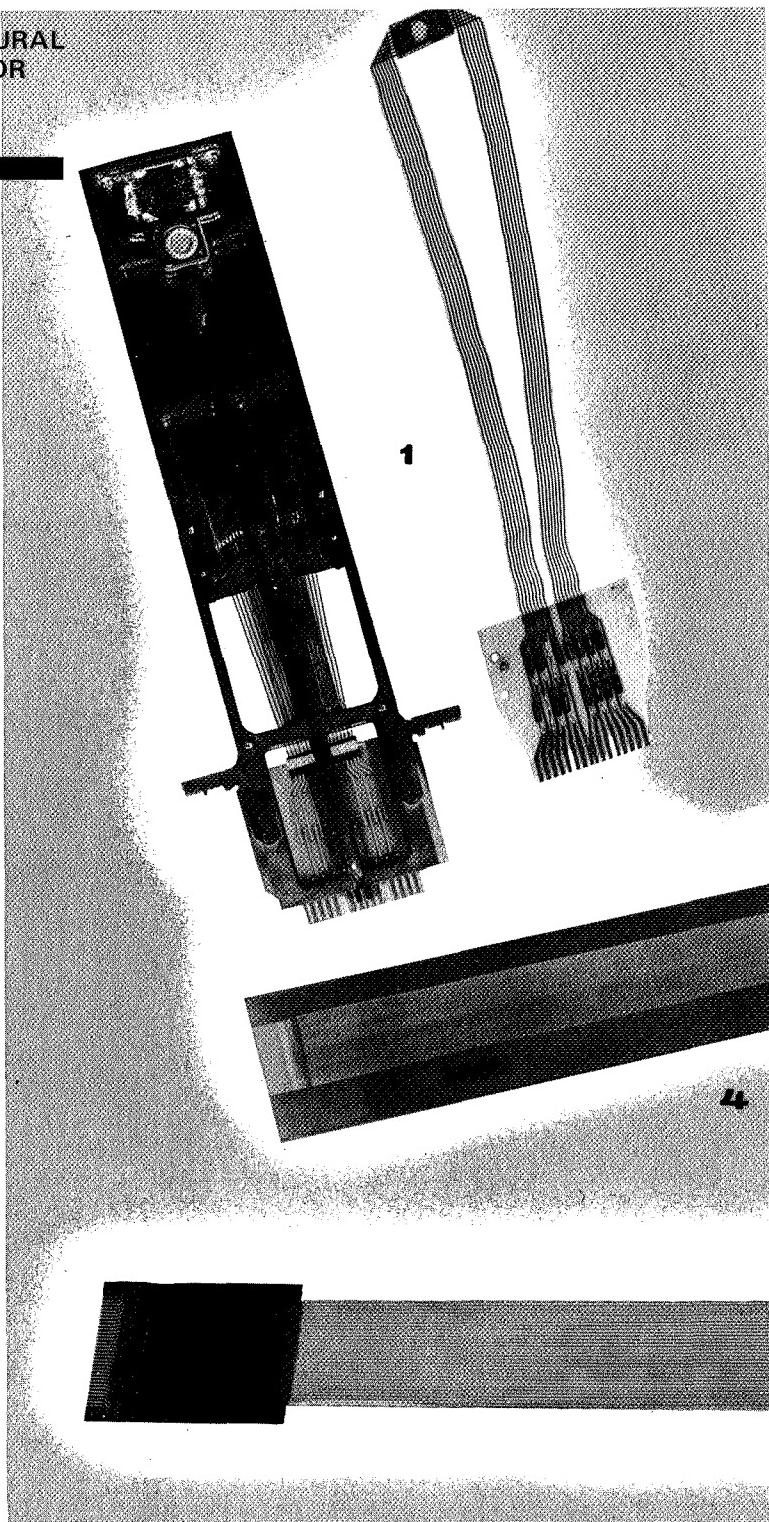

Disc and Drum Memory Interconnection

The requirements for disc and drum memory interconnection wiring for high speed, high "g" loading travel is being met by super flexible Ansley I/S Systems. Laminates of thin (less than 1/2 mil) copper and thin exotic dielectric materials offer lightness, strength and flexibility for multi-million in-service flexures.

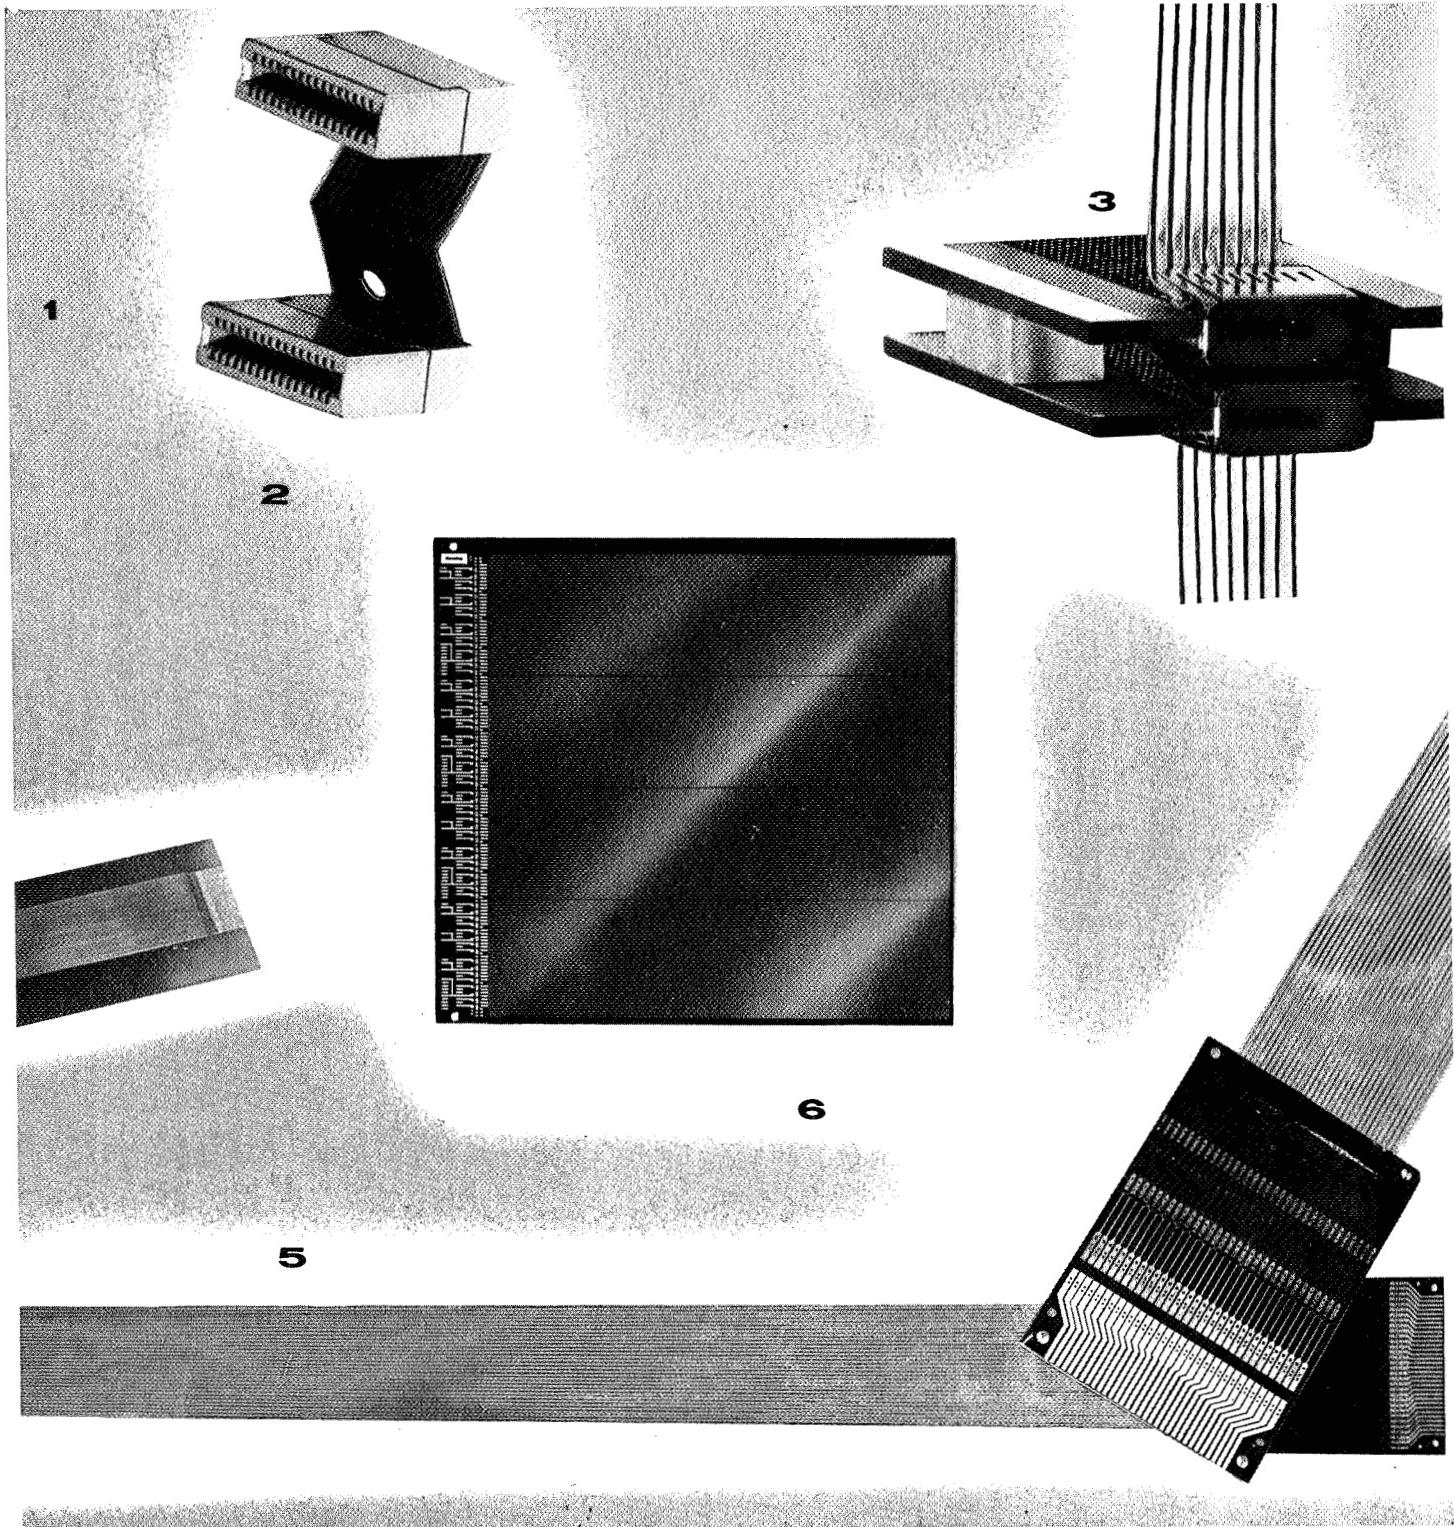

Core Stack Interconnection

Dependant upon each manufacturer's particular design requirements to interconnect adjacent memory planes, Ansley has developed non-removable and removable interconnection systems for plane to plane or Ansley has developed systems stack to stack interconnection. These I/S Systems offer high reliability, lower cost and in most instances distinct servicing or rework advantages.

I/S STRUCTURAL SYSTEMS FOR MEMORY DEVICES

1. Super flexible dielectric films and thin (1 mil or less) copper conductors can be laminated by Ansley to make the cable for Signaflo I/S Systems (superflexible dielectric films cannot be etched). Photo at right is super flexible Ansley I/S System used for Disc Memory interconnection. Oxygen-free rolled copper laminated between thin, super-flexible dielectric material produced interconnection wiring with no measurable resistance to mechanical pressure to magnetic pick-ups from drums floating on air bearings. Photo at left shows assembly installed in carriage. 2. Interconnection jumper for high density core memory stack. Two standard p.c. board dialyl phthalate connectors (.050" pitch). Two layers of polyimide flat cable terminated by Ansley mass bonding, with strain relief provided by glass reinforced nylon cover molded to connector. Pre-folded accordion layers of cable allow stacking density of 5/16" center-to-center of connector for top-to-bottom and bottom-to-top memory interconnection. This type interconnection jumper

assembly is also furnished in other configurations and for screw mounting. 3. Core stack interconnection is but one type which gives extremely high packaging density as well as removability for replacement of a plane. The system shown is for conductors on .050 pitch. 8, 16, 32 and 64 conductor interconnection can be supplied. Conductors are interrupted in connector for 2½ D memories. 4. Ansley I/S System which is a 10" long plated wire support structure with plated wires connected to etched substrate. 5. Over 6' of sense digit cable for planar thin film memory. Close up shows Ansley "Micro-Pitch" cabling of sense digit multiples and their connection to the p.c. board. 6. Ansley I/S System which includes plated wire support structure, word strap and flux concentrator. This I/S System required proper selection of materials, close tolerance positioning and "Micro-Pitch" precision spacing of conductors.

Flex-Weld Cable Assemblies

FOR MILITARY APPLICATIONS

The rigid requirements of the avionics industry for military acceptance demand the use of flat cable assemblies produced by the Ansley Flex-Weld process.

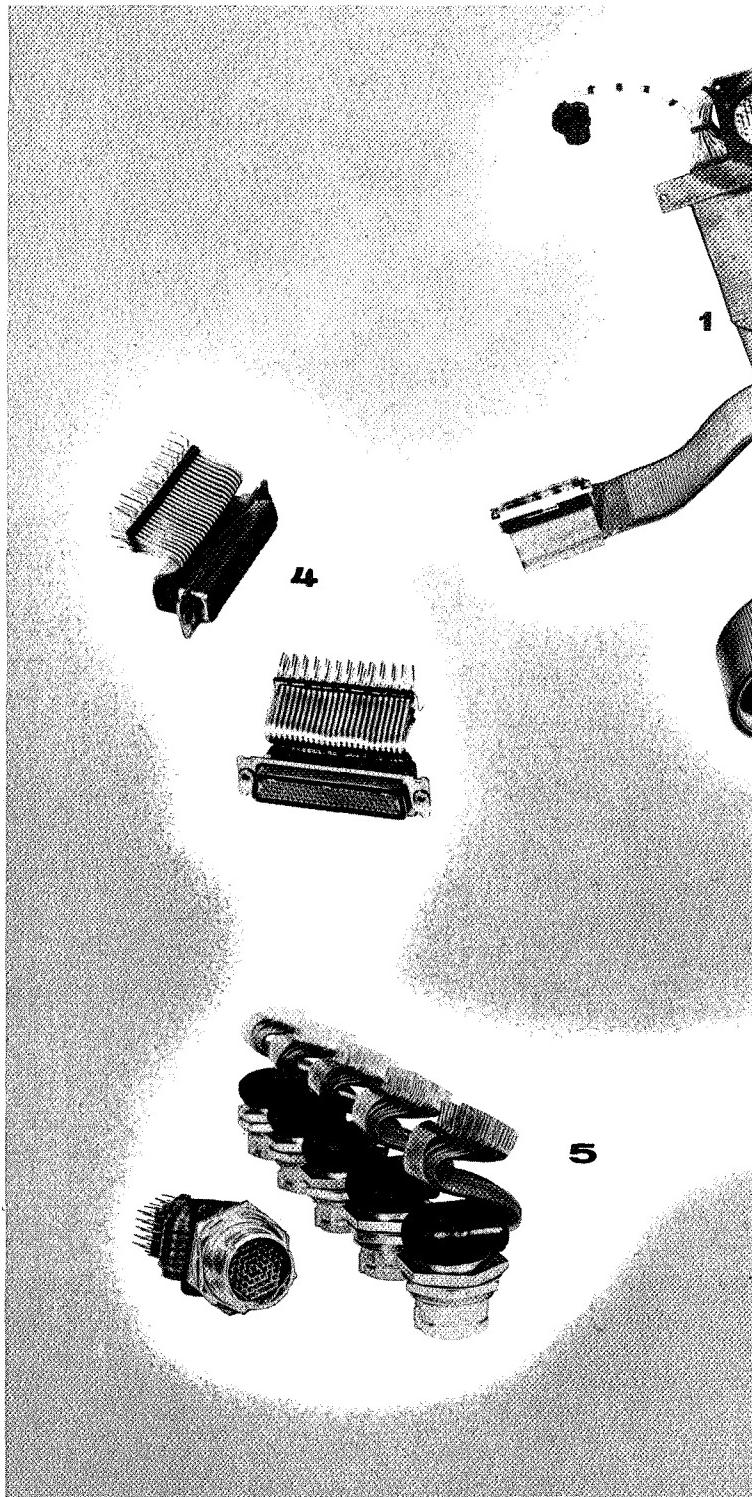

The Flex-Weld process provides strength equal to the original cable material itself, to terminations welded through the insulation without stripping. All-welded hard terminations of pins, eyelets or weld tabs can be made to flat cable and etched circuitry, whether rigid or flexible. Thus every type connector, either rectangular with in-line pin arrangements or round connectors, can be accommodated.

Resistance to severe environments, extreme vibration and shock are demanded. Long-life flexibility, reduced size and weight, elimination of wiring errors, repeatable electrical characteristics and long term reliability are demanded. All these demands are being met with Ansley Flex-Weld cable assemblies.

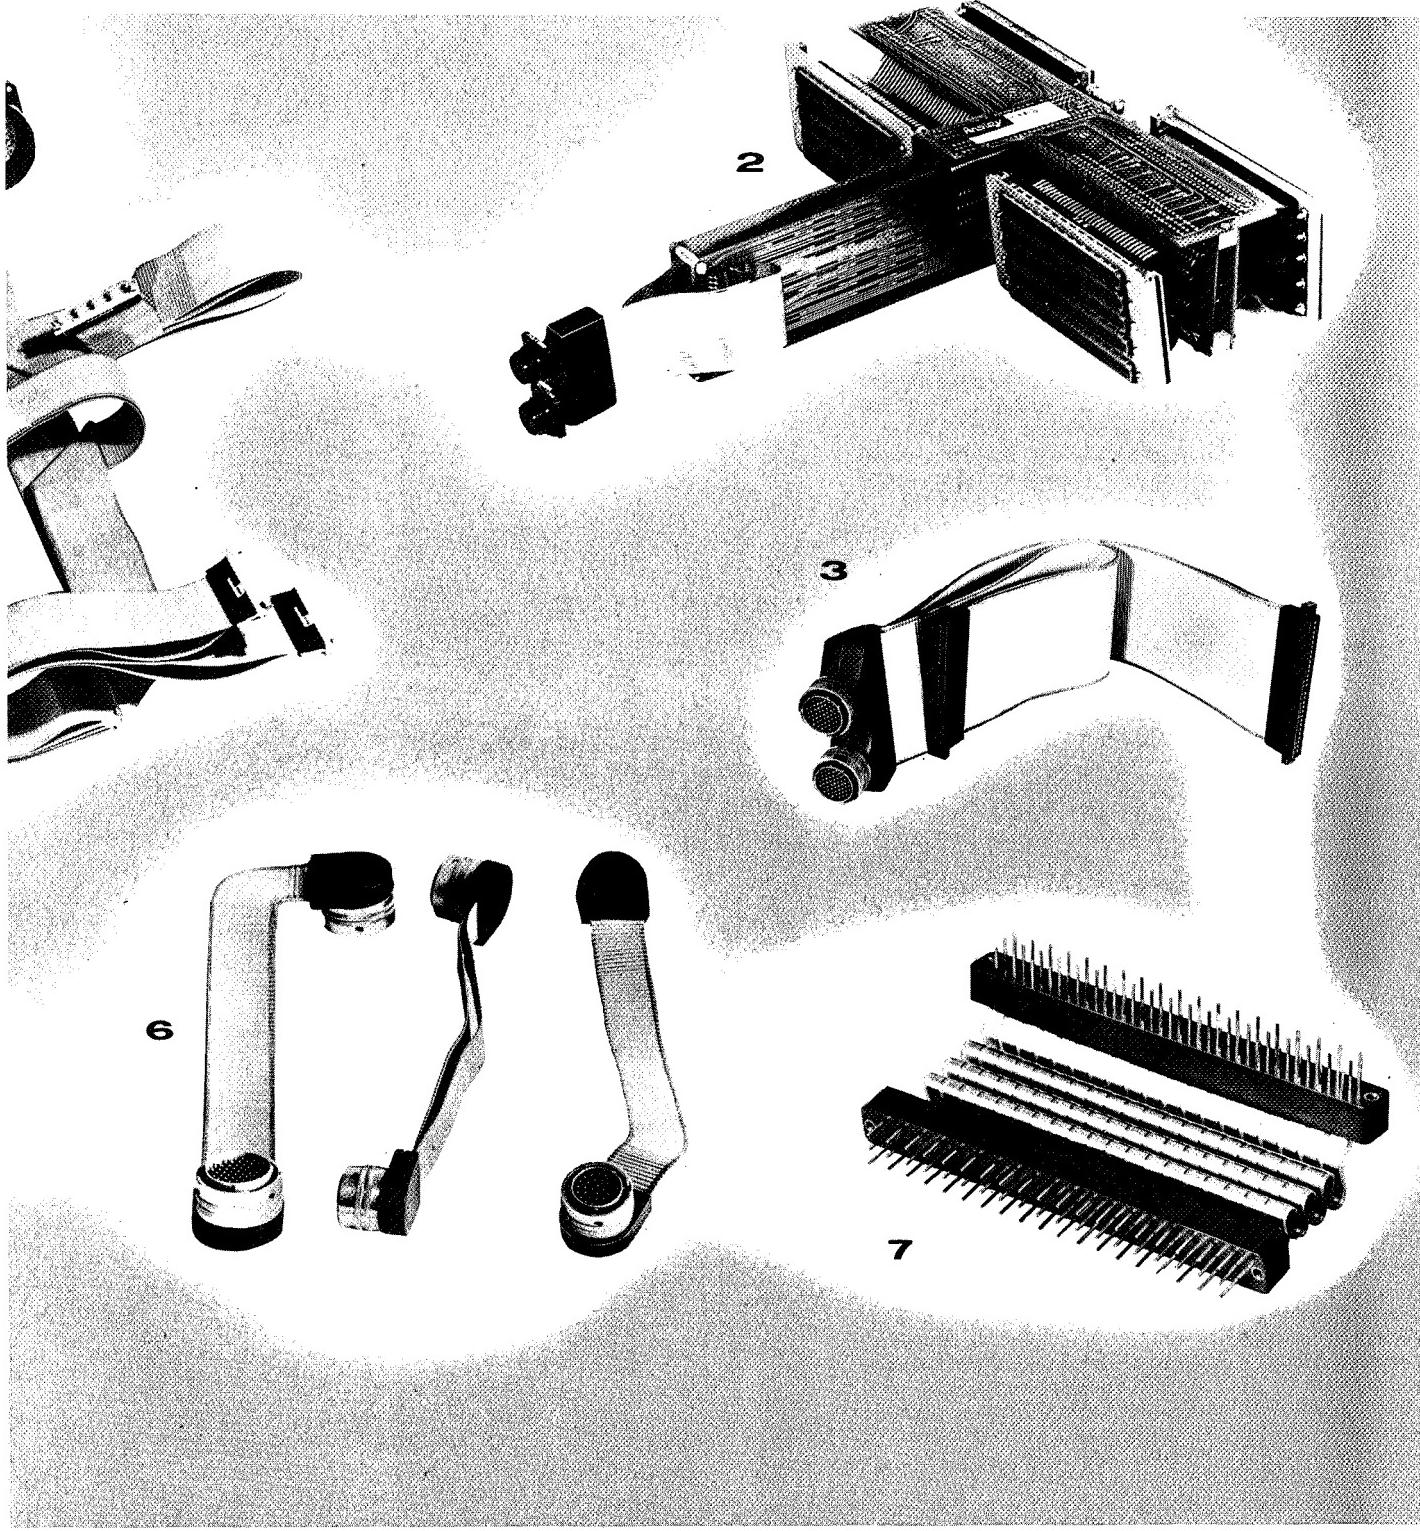

One typical example is a Flex-Weld cable assembly in the Lockheed Agena Space Vehicle. Application of Flex-Weld techniques permitted a 2 to 1 reduction in volume in a circuit distribution center. To accommodate necessary circuit programming changes in instrumentation channels, a wire wrap distribution panel is used to make connections at random among 19 external connectors having a total of 971 contacts. The entire assembly is contained in a box measuring 7 x 8 x 4 inches. Flat conductor cable in multilayer array with electrostatic shielding between layers makes the small size possible. All welded Ansley Flex-Weld terminations provide reliable system operation at 7 G's for 25 minutes on each axis.

Other examples which display equally outstanding solutions to interconnecting wiring are shown on these pages.

Most of the applications on this page show Ansley Flat Cable Systems terminated to AN or other Mil approved connectors for military or aerospace applications. The wide diversity of terminating techniques offered by Ansley make flat cable systems universally applicable.

1. Shielded Flex-Weld® drawer cable with multiple branching permits high density for advanced fire control system. Transition to Bu Webs input/output connectors is made with stranded wire. Internal connectors mate with wire wrap blades.
2. Flex-Weld cable assembly provides integrated interconnect system which accommodates over 2000 random interconnections in advanced avionics equipment. Five multilayer interconnect boards, two 2-sided component boards, 20 cable assemblies with card edge connectors and solder pin terminations, 13 cable assemblies with solder pin terminations at both ends, and one input/output cable assembly form separable modular components.
3. Flex-Weld shielded cable assembly for submarine navigation system console drawer interconnection. Cable withstands over a million flexings over a 1" radius. All cables are shielded both sides

with the shielding periodically welded to ground conductors in the cable. 4. Four layer Flex-Weld flat cable system formed in a service loop for input/output connections from 100 pin miniature D type connector to a mother board. Solder terminal pins coincide with hole pattern in mother board. 5. Multilayer 61 conductor high density Flex-Weld jumper to withstand severe vibration and shock. Carries power supply to mother board in missile application. 6. Flex-Weld shielded two sides, flat cable assemblies for advanced space vehicle application. Corrugations provide flexibility and long flex life. 7. Flexible heavy-duty Flex-Weld jumper for power handling application on advanced missile required copper conductors with .005 x .200 cross section to carry high currents. Three layers of Mylar insulated flat cable are terminated with wire wrap pins.

Free-Flex Etched Circuitry

CHEMICALLY CREATED CIRCUITRY

Free-Flex® Circuitry gives electrical and electronic packaging engineers a versatile design tool to accomplish multiple objectives.

Free-Flex Circuitry includes a wide adaptive range of insulator films: polyesters, fluorocarbons, impregnated glass cloth, epoxy, polyimides and others. The choice of material is dependent upon electrical, physical and environmental requirements.

Conductors are usually electro-deposited or rolled copper foil available in various thicknesses to meet current carrying requirements as well as flexibility. Fine line etching down to .003" line widths and .003" spacing is available and produced with specially processed rolled copper foil, which allows 180° creases in any direction without fear of distortion or cracking.

Many types of conductor terminations are available: solder pads, eyelets, pins, connectors, plated-thru-holes, Ansley Flex-Weld technique, which permits welding through the insulation, or Ansley's mass bonding method.

Free-Flex Mark II Circuitry

Free-Flex Mark II Circuitry is a significant Ansley development for flexible circuit fabrication which fusion bonds FEP Teflon, Kapton and OFHC copper. By eliminating the problems of combining these well proven materials, Ansley Free-Flex Mark II Circuitry is ideally suited to high performance applications, such as:

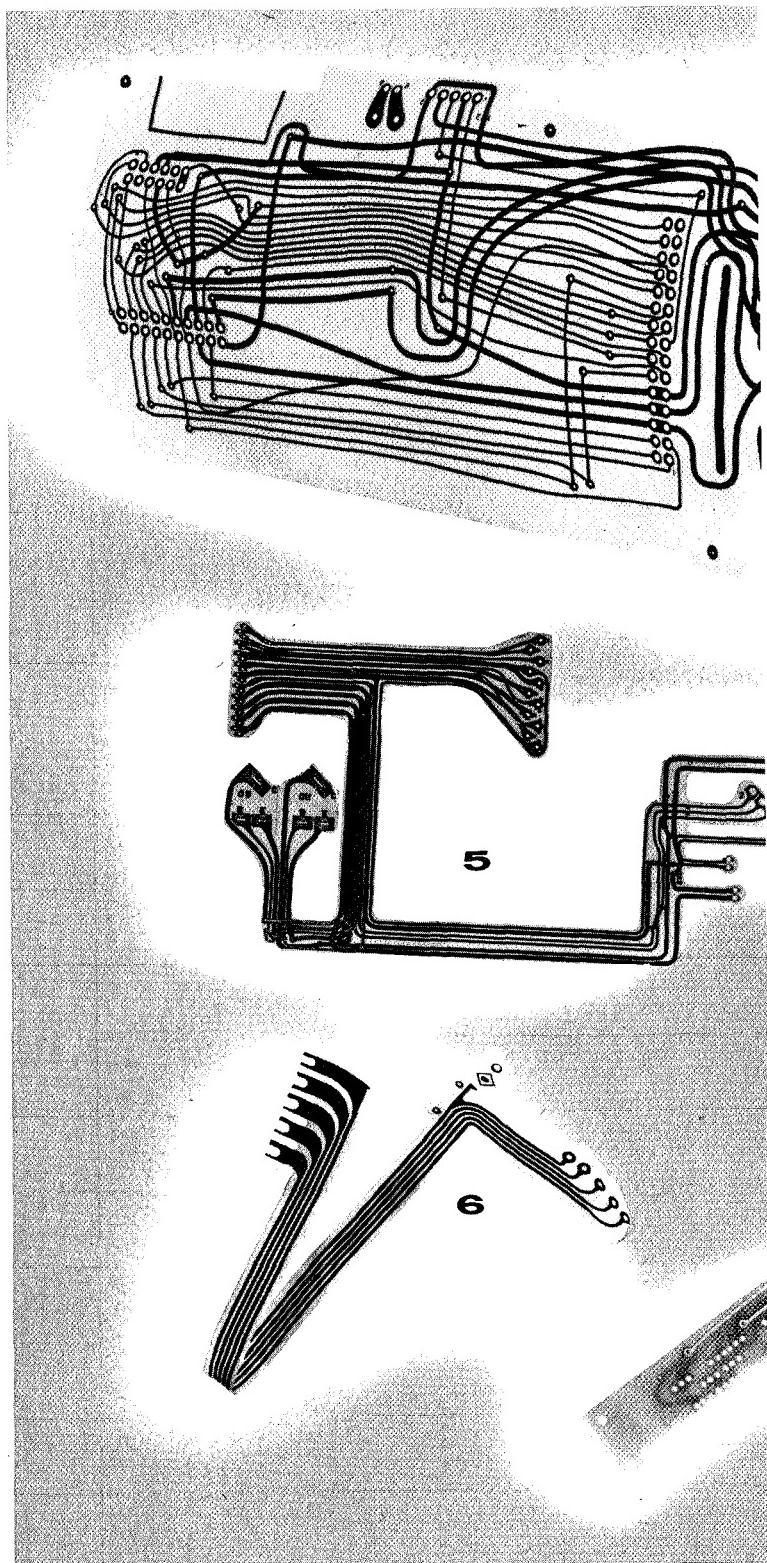

- (a) Single layer flexible circuits.
- (b) Two layer flexible circuits with multiple cross-overs.
- (c) Flexible circuits with crossovers which provide twisted pair electrical characteristics.
- (d) Three-layer circuits with controlled impedance transmission line characteristics.
- (e) Free-Flex cable/connector assemblies.

Kapton gives abrasion resistance, dimensional stability and high strength to Free-Flex Mark II Circuitry. Teflon, which does not absorb moisture and is extremely tear resistant, effectively cancels the deficiencies of Kapton in these properties. Both Kapton and Teflon are excellent for high temperature environments.

Outstanding electrical performance results from the high dielectric strength of Kapton and the low dielectric constant of FEP Teflon. Each conductor is fused to and surrounded by Teflon FEP which provides the best possible electrical isolation. Kapton, bonded to the surface of the FEP Teflon, provides the high dielectric strength to electrically insulate each layer.

The fusion also creates an exceptionally high peel strength and prevents wicking during any subsequent plating or soldering operations.

This Ansley developed fusion bonding process eliminates the need for plated-thru-holes or eyelets, since the open solder pads can be repeatedly soldered without fear of delamination or pad lifting. Complex circuitry can utilize solder pads on both the front and the back side of the flexible pattern.

1. Free-Flex Circuitry for wrap-around application with connecting pads precisely positioned. Various weight copper conductors used to carry current requirements.
2. Fusion bonded Free-Flex Mark II Circuitry hold exposed pads firmly in place for multiple soldering cycles. 3. Flat cable to round wire assembly with fusion bonded Free-Flex Mark II Circuitry providing interconnection strain-relief of unusual strength. 4. Super-flexible fine line etching Free-Flex Circuitry for moving wire application. 5. Above average current required 5 oz. copper conductors and glass reinforced film. Multilayer with interlayer connections accomplished by plated-thru-holes. Interfacial holes are then completely insulated by outer

layers of film. 6. Unusual single layer Free-Flex Circuity with exposed pads for interconnection. 7. Free-Flex Circuity provides an ideal interconnection for hard boards. Ansley mass bonding method used for interconnection which was then stress relieved and insulated with potting compound. 8. Ansley multilayer bus bar with chemically milled conductor elements to provide bussing on mother board. 9. Free-Flex Circuity using hard board material (glass epoxy) for substrate. Rigid hole-to-hole tolerances held on over 1000 plated-thru-holes only .0135" dia.

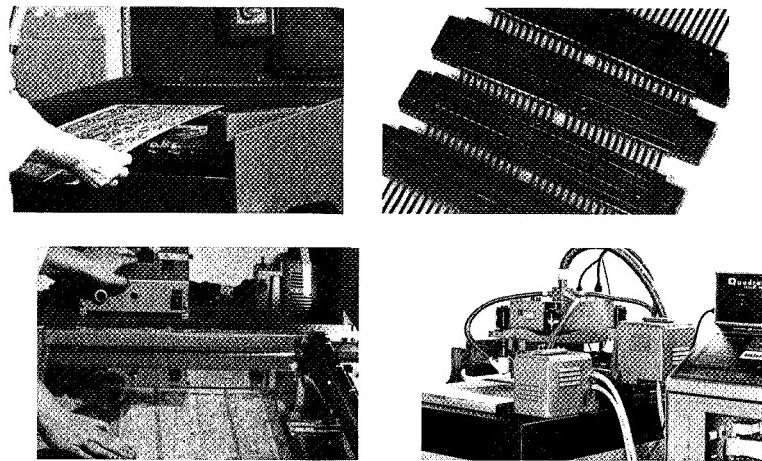

Ansley

Ansley Flat Wiring Systems – Design Criteria

General:

Due to the special nature of each application, Ansley Flat Wiring Assemblies are custom designed. Many systems are designed using combinations of flat cable and chemically created circuitry. Because each method has its own specific design criteria we are presenting the following data in two sections. One covers flat wiring assemblies structured from cable with individual conductors (flat, round or shaped) laminated between various dielectric materials. The other covers flexible etched circuitry which is obtained by chemically producing circuitry on a substrate which is then covered by various dielectric materials.

Ansley's capability in producing all types of interconnection wiring indicates our capacity to respond with practical solutions to the entire electronics industry.

FLAT WIRING SYSTEMS (not etched)

Electrical Characteristics

Current carrying capacity is dependant on conductor dimensions, temperature rise above ambient allowable, conductor and cable geometry and dielectric material used.

The equivalent of AWG sizes from 10 to 60 in various cross-sectional shapes and spacing give wide latitude in current capacity, surge impedance, speed of propagation, attenuation and cross-talk characteristics.

A line to ground DC or peak working voltage of 3000 volts is easily attained with the dielectric materials commonly used.

Ansley Application Engineers have wide experience in the design of systems to meet specific electrical requirements.

Dielectric Materials

Materials used as dielectrics include fluorocarbons, polyamids, polyesters, polyimides, polyolefins, silicone, vinyls and various combinations thereof in order to suit the materials electrically, physically and thermally to the job requirements. Quite often a higher priced raw material will yield a lower cost or better quality system for the same cost than apparent "economy" insulating systems. This is a major part of the Ansley design engineer's responsibility . . . designing the best possible system at the lowest cost to satisfy your requirements for a reliable high quality system.

Lamination

Ansley's rigid specification for cable demands a sealed lamination (when required with a high-strength bond of the conductors to the laminate). In service stability and resistance to environmental conditions are thereby assured. Ansley has developed a wide selection of cable bonding methods and materials . . . some rather exotic, such as one-side-only dielectric.

Conductor Pitch

Standard grid spacings (.025", .050", .062", .075", .100", .156") as well as specials are available. However, Ansley's development of "Spread-Pitch" allows narrow pitch cable to be used and yet match hardware contacts with various dimensions for interconnection simplicity.

Ansley's "Micro-Pitch" allows very small conductors (less than 0.0005") to be closely spaced (0.001") and to be held to extremely close tolerances.

Cable Width and Length

The practical requirements of packaging are usually the limiting factor as to width of cable. Many applications requiring a large number of conductors are best handled by multi layer systems, or reduction of the pitch to produce higher density of conductors. However, cables in excess of 10' wide have been supplied.

Shielded or Unshielded Cable

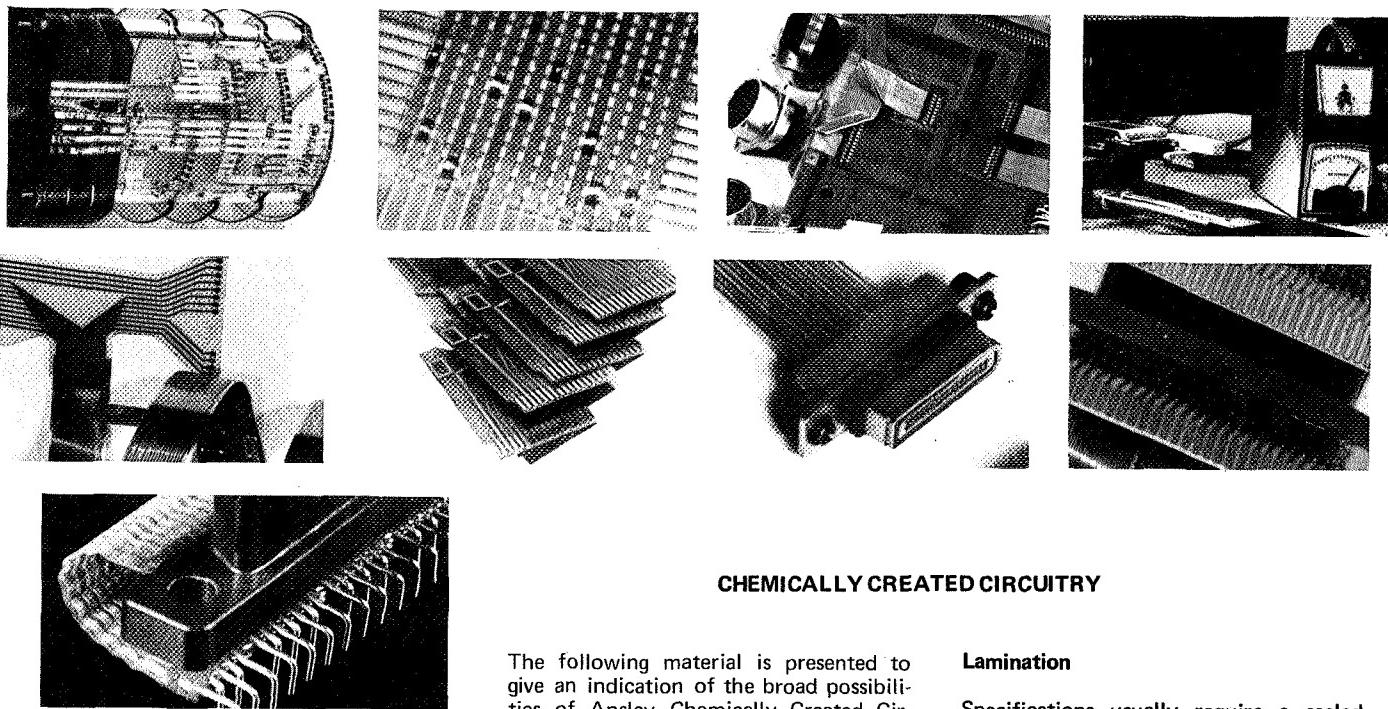

For signal transmission lines the physical as well as the electrical requirement of the application dictate the nature of shielded or unshielded cable. Such controlled characteristics as impedance value, propagation velocity, capacitance and cross-talk level, etc., are possible with Ansley Signalflo Systems. Cabling parameters remain the same from assembly to assembly due to the fixed orientation of conductors; thus capacitance and impedance properties of the system are predictable and may be designed for the specific application. Various forms of conductive material such as metal foil, deposited metal, wire mesh, etc., are utilized on either one or two sides for shielding. Ansley's non-metallic isolation barriers control cross-talk in multi-layered cable systems.

Ansley Flat Wiring Systems Termination Methods

Ansley has developed techniques and processes for reliably terminating flat cable to meet the demands of various environmental, electrical and mechanical requirements for applications over a broad spectrum of both military and commercial applications.

Cable Conductor Used as Contact

This basic method requires stripping the insulation, selective plating of bare conductors and locking in a shell or connector body to become a male blade or female receptacle (See page 10).

CHEMICALLY CREATED CIRCUITRY

The following material is presented to give an indication of the broad possibilities of Ansley Chemically Created Circuitry, which includes Ansley Free-Flex Flexible Etched Circuitry and Ansley Rigid Circuitry. Used singly or in combination or combined with flat cable, cost saving, high reliability circuitry performing multiple objectives can be accomplished. Both photo-etching and chemical milling are basic processes employed to produce Ansley Chemically Created Circuitry.

Materials

Conductors — different metals are available for varying requirements. The usual conductor material specified is electro-deposited or rolled copper foil. This copper foil can be provided in various thicknesses up to 5 oz. Other thicknesses are possible for specialty circuits.

Dielectric substrates — Ansley Free-Flex and Free Flex Mark II circuitry includes a wide adaptive range of insulator films: polyesters, fluorocarbons, impregnated glass cloth, epoxy, polyimides and other base materials. Choice of material is dependent upon the physical and electrical, characteristic and environmental conditions required for specific applications. These materials may also be used in conjunction with the broad range of materials available for rigid circuitry when combinations of Free-Flex circuitry and rigid circuitry are required.

Welded Terminations

Ansley patented Flex-Weld process used to either directly weld the cable conductors to weld tabs or to pins for solder or crimp pots. Welding is through insulation and does not require stripping the insulation. As can be seen in the photographs to the right, the Flex-Weld process permits cable to be terminated into almost any type connector. Round connectors are easily accommodated by folding and forming cable ends to match any contact layout. All connectors are normally potted for stress relief. For flexible etched circuitry the Flex-Weld process provides all-welded hard terminations of pins, eyelets or weld tabs.

Ansley Mass Bonding

A proprietary process developed to terminate all the conductors of multi-conductor cable at one time. This has drastically reduced the cost of reliably terminating flat cable to rigid or flexible circuitry. Many of the illustrations throughout this booklet are examples of Ansley mass bonding flat cables to rigid circuitry or the interconnecting of closely spaced conductors required by I/S Systems for Memory Devices. Mass bonding requires that the cable insulation be stripped — again by proprietary techniques developed by Ansley.

The termination of flat cable to rigid circuitry makes it possible to utilize the advantages of multilayer boards with plated-through holes for component mounting, etc.

Lamination

Specifications usually require a sealed lamination with a high strength bond consistent with stability and resistance to environmental conditions.

Line Etching

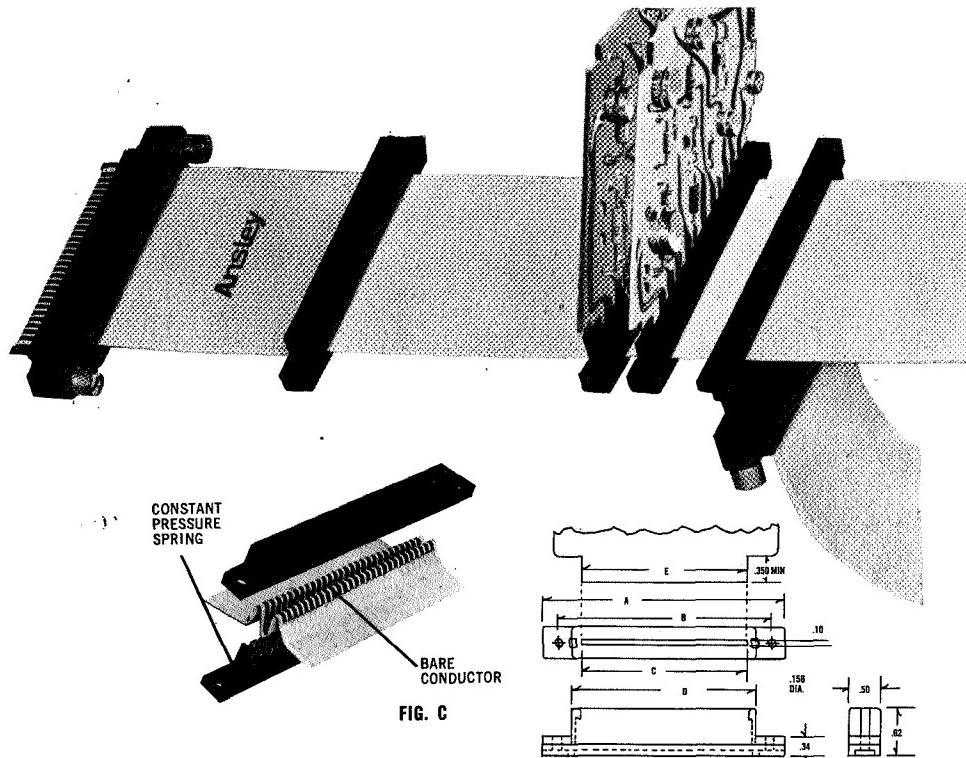

Fine line etching down to .003" line widths and .003" spacing is available. Free-Flex circuitry requiring 180° creases in any direction without fear of distortion or cracking produced from film with specially processed rolled copper foil of exceptionally fine grain structure.

Termination

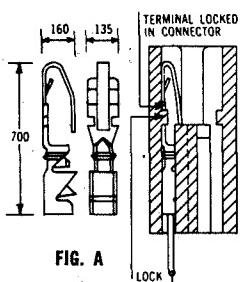

In general, solder pads, eyelets, connectors, plated-thru-holes and welded thru the insulation pins, using the Ansley patented Flex-Weld process, are used.

Interconnection of flat cable or hard boards to flexible circuitry is made economically by the Ansley mass bonding process which simultaneously interconnects even extremely fine line etchings. This has greatly reduced the cost of interconnections, especially in miniaturized circuitry. The circuitry package can be greatly simplified using plated-thru-holes for layer-to-layer interconnection in multilayer circuitry.

Ansley

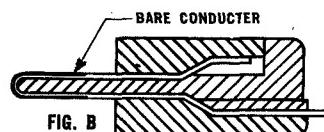

Basic Elements and Techniques of Ansley Flat Wiring Systems

**Transitional Connector
for Round Wire**

Often equipment uses round wire and to make the transition to Flat Conductor Cable, Ansley has designed a receptacle block to hold leads having especially designed crimped Ansley terminals which are firmly locked into precision cavities (See Fig. A. above). Wire-wrap pin contacts are also available. The block is molded of dimensionally stable polycarbonate resin. Circuit numbers are molded on the connector shell for identification. Terminals are gold plated beryllium copper, providing positive, spring contact and long insertion life. Built-in polarity key and security lock* assure proper alignment and positive holding.

*Quarter-turn fasteners also available.

**Male Connector
for Flat Conductor Cable**

Ansley utilizes the conductor itself, which is selectively gold plated, for contact. This eliminates increased resistance points. The gold plated contact area of the Flat Conductor Cable is folded and locked into the male connector (see Fig. B. above). Conductor blade makes firm contact with female receptacle. Polarity key and security locks* provide proper mating. Circuit identification numbers are molded onto the connector.

Mid Span Tap (Flat To Flat)

The selectively gold plated contact area of the Flat Conductor Cable is formed and locked into the connector housing. To assure positive electrical contact of each conductor, a stainless steel spring exerts pressure on each conductor.

The spring itself carries no electrical current — its function is mechanical only. (See Fig. C. — above). The Mid Span Tap is molded of dimensionally stable polycarbonate resin. It can be positioned to receive interconnection from either side of the cable.

PLUG-IN DIP SOCKET CABLE JUMPERS for highest packaging density and wiring versatility

Ansley DIP socket jumper cable assemblies offer an outstanding combination of high packaging density, maximum wiring versatility and lowest installed cost.

Essentially the jumper assembly comprises a specified length of Ansley flat, flexible cable with low profile connectors. Thanks to the considerable weight and space savings of these jumpers, maximum packaging density is achieved.

Low Profile. The glass-filled connectors used for Ansley jumpers measure less than $\frac{1}{4}$ " thick, providing the lowest profile available. Cable profile is also extremely low with $0.010"$ as standard. All leads are flat to permit wave soldering on boards.

Choice of Configuration. Ansley jumpers can be provided with any number of connectors per cable, spaced as closely as every $\frac{1}{2}$ "—uniformly or at random. Various connector configurations and pin orientations are also available. As desired, the cable can exit from either side of the connector and, unlike any other jumper assembly, can exit at a 90° angle from the connector without increasing connector width.

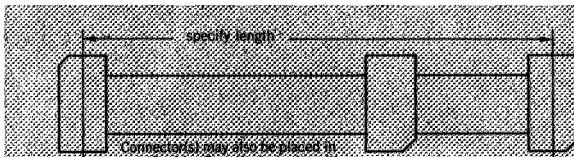

Figure 8

ELECTRICAL CHARACTERISTICS OF CABLE

Polyester / Vinyl	Polyester	FEP	Polyimide
Characteristic Impedance	134 ohms	147 ohms	161 ohms
Velocity of Propagation	1.45 nanosec./ft.	1.34 nanosec./ft.	1.32 nanosec./ft.

Temperature Rating (Continuous)	80°C	90°C	200°C

Ordering Information for Ansley Jumper Cables

To order an Ansley Jumper Cable Assembly, please use the basic part number plus four dash numbers.

Basic Part Number: 614 14 lead cable assembly
 616 16 lead cable assembly

First Dash Number: Dielectric material.

—P Polyester/vinyl	—F FEP Teflon
—M Polyester	—K Polyimide

Second Dash Number: Total length in inches from centerline of connectors.

Third Dash Number: Quantity of connectors.

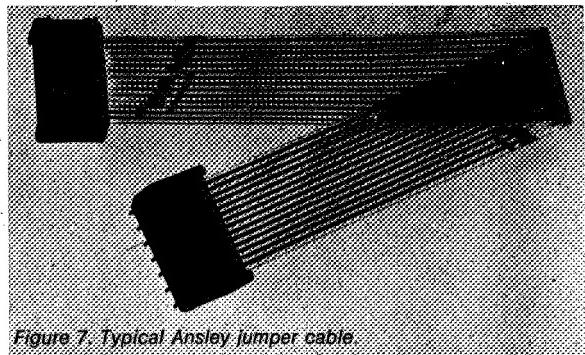

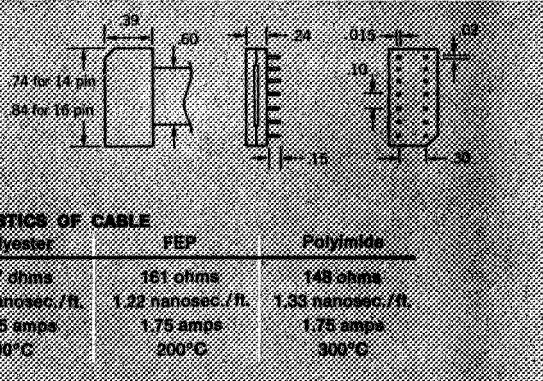

Figure 7. Typical Ansley jumper cable.

A Complete Assembly. Ansley jumpers are furnished completely assembled, tested and ready to plug in. Connections are mass bonded for highest reliability.

Wide Variety of Materials. Standard cable is $0.60"$ wide $\times 0.01"$ thick with 14 or 16 flat conductors on $0.040"$ centers. Available dielectrics include polyester/vinyl, polyester, FEP Teflon and polyimide. Standard contacts are phosphor bronze, gold plated over nickel flash.

Fourth Dash Number: Orientation of connectors on cable (refer to Figure 9.)

For example, to order an 8" long, 14 lead cable assembly with polyester/vinyl dielectric, and two connectors, each with pins down, numbered L to R, use part number 614-P-8-2-AA.

NOTE: When more than two connectors per cable are required, please specify locational dimensions.

A technical line drawing of a mechanical component, possibly a bearing housing or a similar assembly. The drawing shows a central vertical shaft with a flange at the top. A housing is attached to the shaft, featuring a rectangular opening with a stepped profile. Three horizontal dimensions are indicated on the right side: 4.75, 4.65, and 5.50, likely representing distances from the bottom surface to specific features like shoulders or holes.

This technical drawing illustrates a pin or socket wafer assembly. It features a central rectangular base with a central cavity containing a ribbed cylindrical component. A vertical pin extends from the top of this component. The base has two horizontal flanges on its left side. A dimension line indicates a width of .125 inches between the outer edges of these flanges. A dimension line also shows a height of .15 inches from the top surface of the base to the top of the pin. A callout labeled 'SEE DETAIL B' points to a section showing a cross-section of the pin and its seating area. Another callout labeled 'SEE DETAIL A' points to a section showing a top-down view of the base and pin assembly.

This technical drawing illustrates a pin or socket wafer assembly. It features a central rectangular base with a central cavity containing a ribbed cylindrical component. A vertical pin extends from the top of this component. The base has several rectangular cutouts along its perimeter. A dimension line indicates a width of .125 inches for the base. A dimension line also shows a height of .150 inches for the entire assembly. An angle dimension of 32° is shown between the vertical pin and the top surface of the base. A callout labeled 'SEE DETAIL B' points to a small rectangular feature on the side of the base. Another callout labeled 'SEE DETAIL A' points to the top edge of the base. A callout labeled 'PIN OR SOCKET WAFER SEE TABLE 6 PAGE 9' points to the central cylindrical component.

This technical drawing illustrates an alternate chamber assembly. The main structure is a rectangular box labeled 'H' at the top left. A vertical slot labeled 'J' is located on the left side. On the right side, there is a circular cutout with a diameter of $.151$ inches, labeled 'I'. Above the main box, a horizontal pipe section is shown with a length of 310 inches and a width of 290 inches. This pipe section is angled upwards and to the right, with a total height of $4\frac{7}{8}$ inches. The pipe section is labeled 'ALTERNATE CHAMFER'. To the right of the pipe section, another pipe section is shown with a height of $.570$ inches and a width of $.265$ inches. This pipe section is labeled 'R TYP.'. At the bottom center, there is a circular component with a diameter of $.060$ inches, labeled 'R TYP.'. The entire assembly is labeled '140 FULL R TYP.'.

Series 50

flat cable connectors

Connectors for flat center conductor or round center conductor (ribbon) cable on 50-mil centers.

- No special tool required
- Assembly: As easy as "A, B, C":
 - A. Cut cable end square (with razor blade, scissors, or shears).
 - B. Place cable into connector; position cable conductors with connector registration marks.
 - C. Screw clamp plate to connector.
- Field serviceable
- Replaceable contacts
- Weatherproof seals available

flat cable connectors

The new Series 50 Flat Cable Connectors have been specifically designed to satisfy the termination problem of flat and round conductor cables. These connectors can be used in military and commercial communications, computers, office equipment, aircraft, home entertainment systems and control systems.

Connector Types

- Flat Cable Plug
- Flat Cable Jack
- Printed Circuit Receptable (50-mil centers, single-sided; 100-mil centers, staggered, double-sided)
- Wire Wrap
- Integrated Circuit Holder
- Terminal Junction Block
- Discrete Wire (Solder)

Performance

- Contact Resistance: 7 milliohms @ 1 ampere
- Current Capability: 2 amperes
- Voltage Breakdown: 750 VRMS @ sea level
- Cable Retention: 25 pounds min.

FLAT CABLE

CONNECTORS

It's about time someone came up with a high-speed, shielded flat cable interconnection assembly that really performs. Naturally, it had to come from Malco. Flexible flat cable with connectors that meet high-reliability requirements . . . an important new addition to Malco's ever-growing line of

RACK-MATES

Flat Cable Has Finally Become Practical...

Malco innovative engineering and precision tooling add a new dimension to the flexibility of flat cable. Malco's newest Rack-Mate, **FLAT CABLE** features:

Shielding throughout length of cable all the way to the point of connection.

Unique connector allows mating of flat cable to any .025 sq. wrapost tail on .100, .125 or .150 centers.

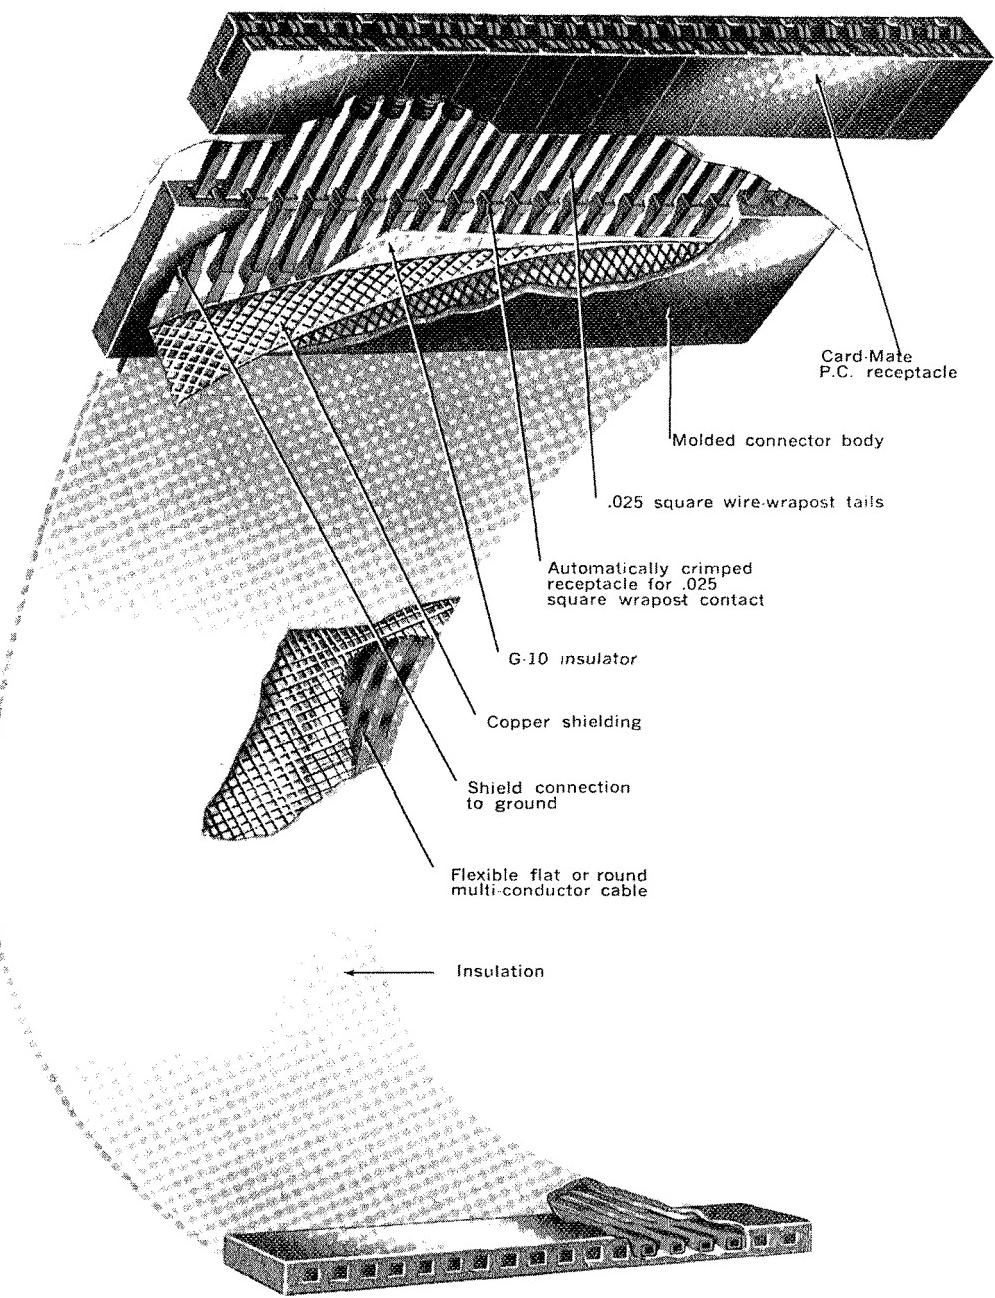

For the first time, contacts can be automatically crimped to multi-conductor round or flat cable--with consistent reliability.

New molded connector design separates and locks the crimped contact into place, insuring a solid strain relief.

Individual contact barriers guarantee outstanding dielectric properties.

High-quality 4-leaf contacts provide a consistent, clean wiping connection to .025 sq. wrapost.

Total resistance of double connection (contact to wrapost, crimp to cable) is 7 milliohms maximum.

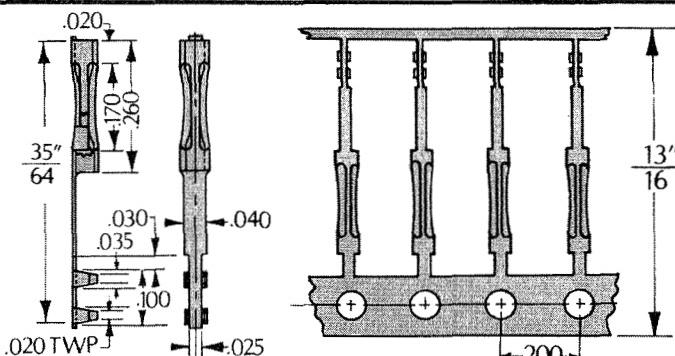

Malco introduces shielded flexible flat cable with reliable, high-speed terminations.

Malco introduces shielded, flexible flat cable jumpers with reliable terminations. Now, through Malco's creative design, flat cable is finally practical, reliable and extremely economical. In addition to saving vital space, Malco's flat cable jumpers offer a considerably higher level of reliability while reducing your overall harness costs.

Although off-the-shelf cable and connectors are available, various cable and connector configurations can be custom designed to your specifications at exceptionally reasonable cost. All connector as-

semblies are designed to meet your precise requirements. You can specify shielded or non-shielded cable, flat or round multi-conductor cable, number and position of precision crimp receptacles, wire gauge and any other variations to fit your design. Malco also offers a wide variety of reliable interconnection and terminating configurations to add even more versatility to your package.

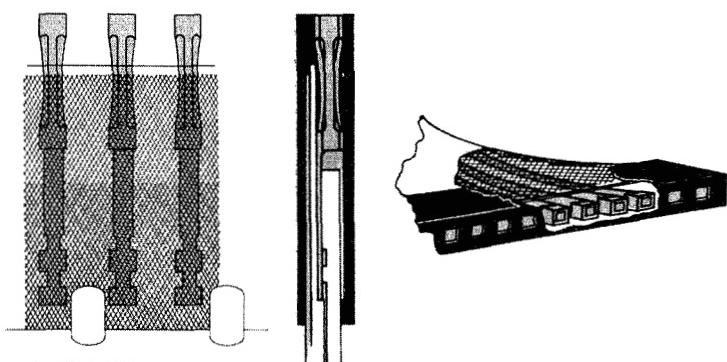

What makes Malco's flat cable connectors practical? Reliability and design simplicity!

1. Automatically Crimped Contacts

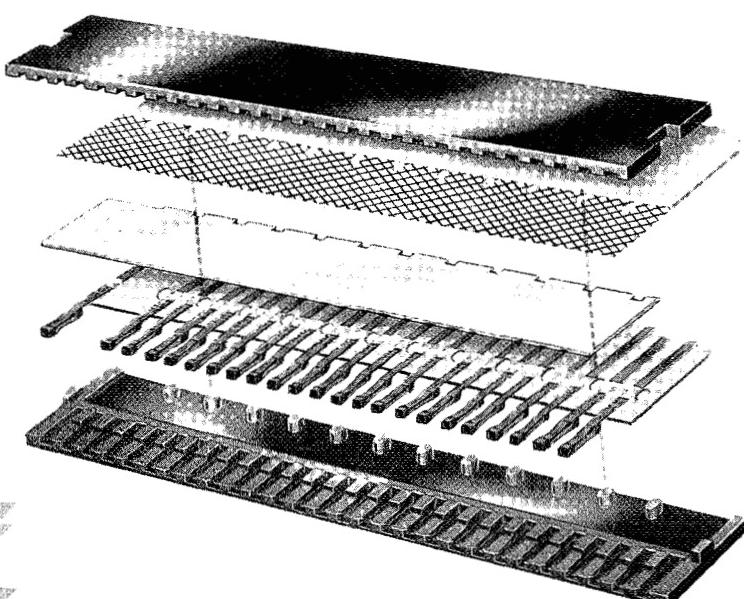

Malco's precision, low resistance 4-leaf contacts are automatically crimped to stripped cable in a fraction of the time it takes to strip and terminate conventional cable assemblies. The terminals accept flat or round conductor with equal facility and attach firmly to any .025 square contact. A stop is available in contact area to prevent disruption of 2nd level wire wrap connection.

Because of the positive terminal crimping and receptacle design, Malco's new 4-leaf contact assures consistently low resistance connections at both critical connection points. The unique 4-leaf contact is produced from .007 beryllium copper; plating is .000020 gold per MIL-G-45204 over .000050/.000150 nickel per QQ-N-290. Other finishes are also available on request.

2. Shielding

Another important Malco innovation is the availability of shielding throughout the length of the cable *all the way to the point of connection*. This unique feature makes side-by-side cable stacking possible by reducing crosstalk and interference to a minimum. This Malco feature becomes especially important when you design for high-speed circuits.

3. Unique Connector Assembly

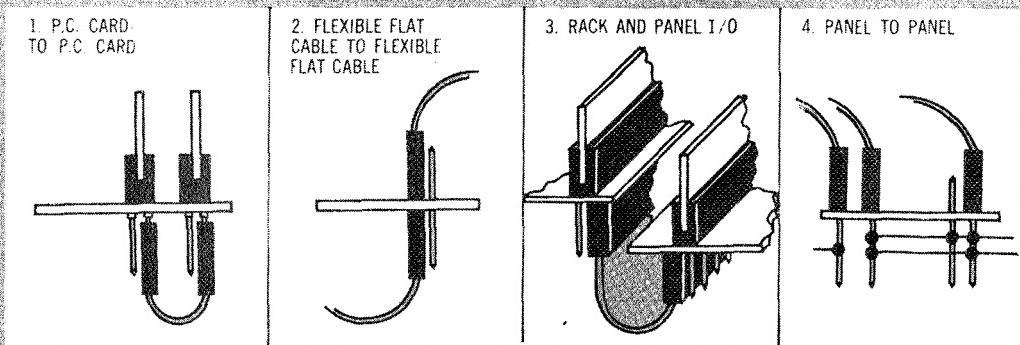

Malco's new molded connector housing holds contacts and cable firmly in place and then is ultrasonically welded together to form a rigid connector. Slots in the housing hold and separate each terminal. In addition, prepositioned strain relief holes in the cable affix the connector to the cable for added rigidity and strength. With the addition of the connector assembly, the crimped terminals become a solid connector for I/O cable, cable-to-cable, card-to-card and panel-to-panel functions. By controlling all materials, finishes, components, tooling and processes, Malco can positively assure the highest degree of reliability at a minimum cost for your flat cable interconnection configurations.

MALCO[®]
FLEXIBLE FLAT CABLE

MALCO PUTS FLEXIBILITY IN FLEXIBLE FLAT CABLE

New, automatically crimped contacts, shielding, molded body assembly and an infinite variety of wires and conductors make Malco's flat cable the most useful and practical cable available. But that's only the beginning. Add to these advanced characteristics a wide variety of interconnection and terminating configurations...and you have a total flat cable package.

FLAT CABLE INTERCONNECTION CHARACTERISTICS

Mechanical

1. Insertion of 4-leaf contact:
10 oz. maximum individual per .025 square wrap post
2. Retention of 4-leaf contact
2 oz. min. individual
3 oz. min. average
3. Contact: .007 beryllium copper
4. Connector Housing: Noryl SE 1
5. Plating: As required
6. Cable insulation: PVC or Teflon

Electrical

1. Contact current rating: 3 Amps
2. Contact Resistance:
Total of crimp and wrap post connection:
7 milliohms max. plus cable length resistance
3. Dielectric Withstanding Voltage:
500 VDC min. at sea level
4. Insulation Resistance
5000 megohms min. at 500 VDC

Important Notice: For design details and additional information about Malco Flat Cable Connectors and other Rack-Mates, please write us on your letterhead specifying intended application.

We solve your mating problems.

C

C

"FLEXMATE" Connector Series Metal Shell Flat Conductor Cable Connector

With the new Flat Conductor Cable Connector, you can completely terminate and circuit check a cable *before* the finished assembly is inserted into the metal housing. Never again will you detect a wiring error after the connector is fully assembled.

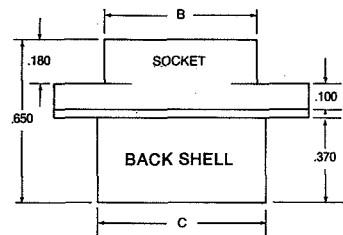

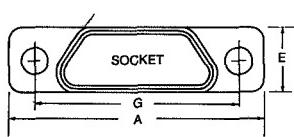

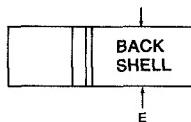

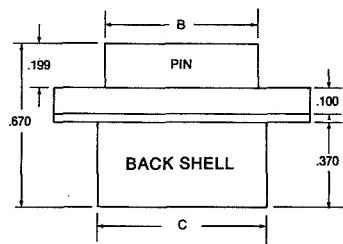

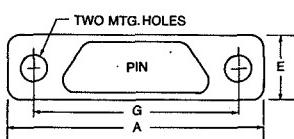

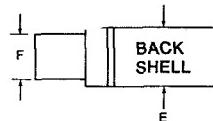

This new line from Microdot is intermountable and intermateable with all plastic and metal types in the MICRO/CON line. The new types also utilize the proven TWIST/CON configuration. The connectors accommodate cable built to MIL-C-55543, in widths of $\frac{1}{4}$ ", $\frac{1}{2}$ ", and 1" — and any commercial cable of various widths with 0.050" centers. Units are available with pin layouts as few as 9 and as many as 51.

The connector utilizes a housing identical to that of the Microdot Metal Shell MICRO/CON D. The flat conductor cable is welded or soldered to a plastic module which is plugged into the back of the connector. A back shell, mechanically attached to the front of the connector, holds the modules in place.

For use in harsh environments, the connectors can be supplied with interfacial sealing — and if additional sealing is required, can be potted.

Without pottng, the Microdot Inc. Flat Conductor Cable Connector is a field repairable unit, rear insertable, and rear removable. The only available unit on 0.050" centers that is!

Nomenclature for Flat Conductor Cable Connectors

MCD M2 37 P F 1 18.0

Lead length in inches XX.X

Method of termination

- 1 — Full complement welded.
- 2 — Full complement soldered.

Flat Conductor Cable Type

- F — Wafers without cable termination
- C — PVC insulated FCC
- K — Kapton insulated
- M — Mylar insulated

Contact Type

- P — Pin
- S — Socket

Layout

- 9, 15, 21, 25, 31, 37, 51

Shell Type and Material

- M2 — Metal Shell
- Screw Mount
- Diallyl Phthalate Inserts
- (FCCC Hardware)

P — Polyethylene insulated

T — Teflon insulated

X — Special custom cables

Connector Series

Technical and Performance Data

Performance:

CONTACT RESISTANCE

The average mated contact resistance is 4 milliohms, with a maximum value of 8 milliohms, using standard #24 solid copper leads when measured directly behind the crimp joints of the mated pin and socket contacts. The average resistance value at 100 microvolts is 4.8 milliohms.

DIELECTRIC WITHSTANDING VOLTAGE

(60 Hz rms room temperature)

Sea Level 1000
70,000 feet 300

VIBRATION

(Per Mil-Std-202C, method 204-A, condition D)

No discontinuity in excess of 1 microsecond during twelve 20 minutes sweeps from 10 to 2,000 CPS at .06 double amplitude or 20 G forces, whichever is less.

CORROSION RESISTANCE

(Per Mil-Std-202C, method 101B, condition B)

Both mated and unmated samples do not exceed the maximum allowable contact resistance (8 milliohms) when subjected to the 48 hour salt spray test.

DURABILITY

The contact resistance after 2,000 mating cycles is less than the maximum allowable, 8 milliohms.

INSULATION RESISTANCE

Greater than 5,000 megohms at room temperature for the materials listed under MATERIALS.

MAXIMUM CURRENT CARRYING CAPACITY

No. 24 contact 3 amperes

It must be recognized, however, that all the wires to a connector will not carry their maximum current under all environmental conditions due to wire temperature.

CONTACT ENGAGING AND SEPARATION FORCES

6 oz. maximum
0.5 oz. minimum

TEMPERATURE RANGE

(Operating)

Diallyl phthalate -65°F to +300°F

Materials:

INSULATOR

Diallyl phthalate per MIL-M-14, Type SDG-F

CONTACTS

Pin contact — Copper alloy (Alloys of beryllium copper and brass make up the complete construction.)
Socket Contact — Copper alloy

BODY SHELLS

Pin Body Shell, stainless steel, Types 304

Cond. A per QQ-S-766

Socket Body Shell, aluminum alloy per QQ-A-591, A-380 Alloy

FLAT CONDUCTOR CABLE BACK SHELLS

Same as Pin Body Shell above.

Finishes:

INSULATOR

None

CONTACTS

Standard finish is 0.000050 gold over copper flash per Mil-G-45204, Type II

BODY SHELLS

Pin Body Shell, passivated per Mil-F-14072 (E-300)

Socket Body Shell, electroless nickel per Mil-C-26074, Class 1, except thickness is .001/.0015

Note: Insulators are molded into their metal shells — No bonded joint is used.

FLAT CONDUCTOR CABLE BACK SHELLS

Same as Pin Body Shell above.

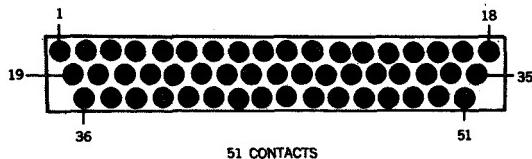

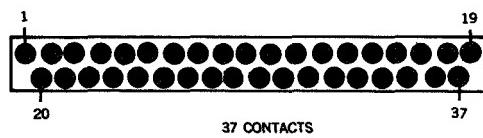

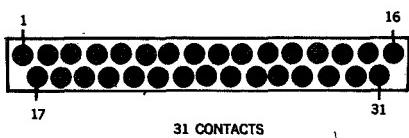

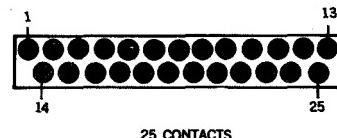

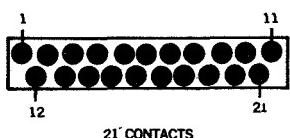

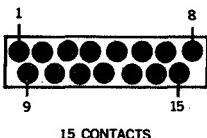

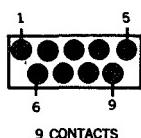

FLAT CONDUCTOR CABLE ACCOMMODATION

Up to 19 conductors on .050" spacing. Total complement of Micro/Con line can be used.

THE M55544/7 PLUG PARTS SHOWN ARE REQUIRED FOR THE COMPLETED PLUG ASSEMBLY.
THE COMPLETE PART NUMBER IS SHOWN ON TABLE I ON PAGE 2 AND CONSISTS OF (1) EACH
OF THE FOLLOWING MOLDED INTEGRALLY WITH THE PLUG BODY:

WINDOW PIECE	- POLYPHENYLENE OXIDE
CONDUCTOR SPACER	- POLYPHENYLENE OXIDE
INSULATOR	- SILICONE RUBBER

THE PLUG BODY, MOLDED IN PLACE, IS MADE OF POLYPHENYLENE OXIDE.

THE SEAL, ASSEMBLED AFTER MOLDING, IS MADE OF SILICONE RUBBER AND CEMENTED TO BODY.

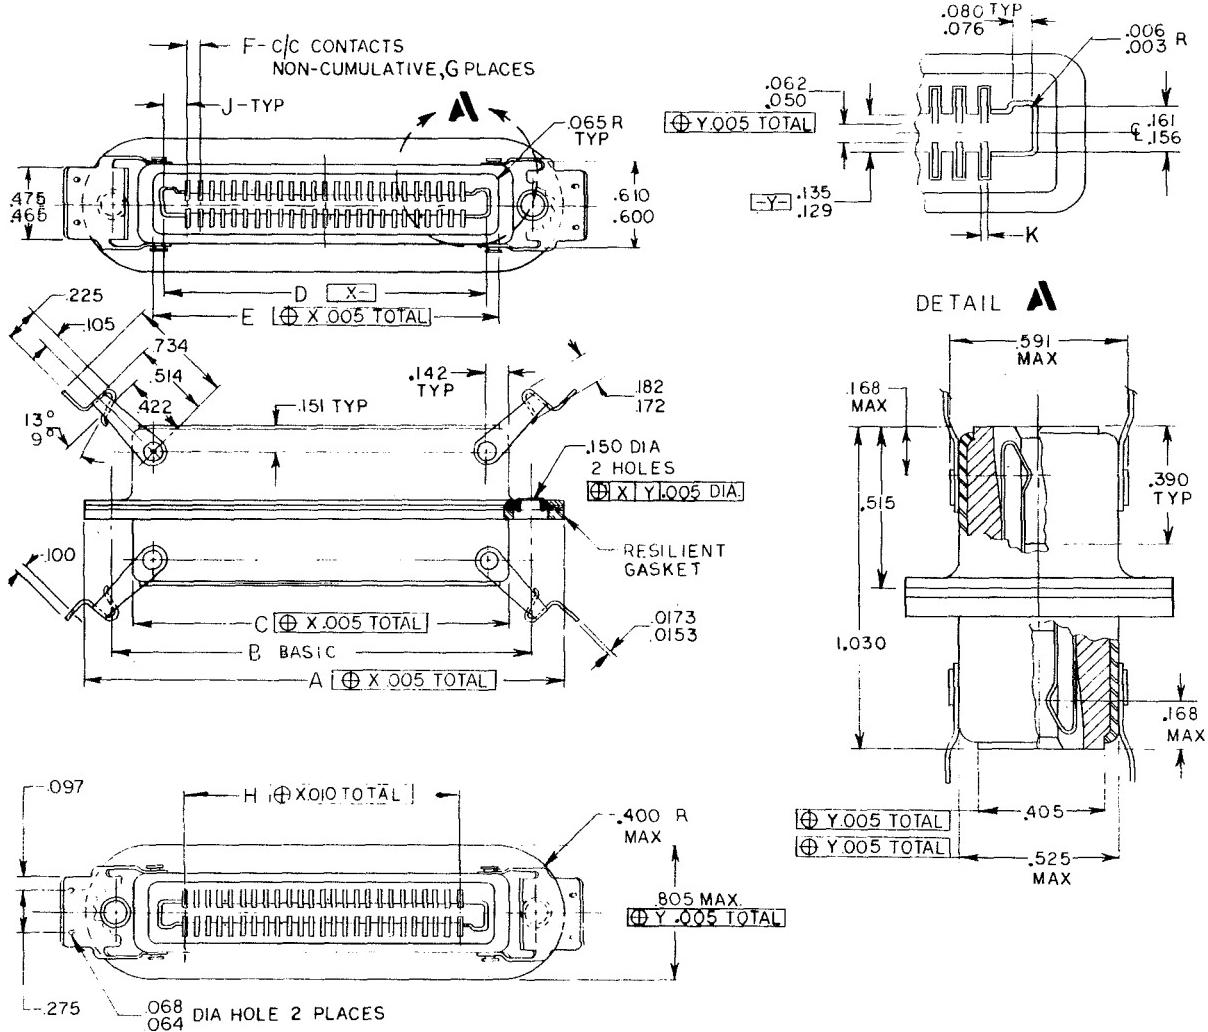

THE CABLE IS NOT PART OF THIS SPECIFICATION, BUT IS TO BE CALLED OUT AS REQUIRED ON THE
USING DRAWING. THE POTTING MATERIAL WILL ALSO BE CALLED OUT AS REQUIRED ON THE USING
DRAWING.

THE CABLE SHALL BE PREPARED AND THE ABOVE LISTED PARTS SHALL BE ASSEMBLED PER
DRAWING MS 75079 "METHOD DRAWING - M55544/7 PLUG ASSEMBLY, FLAT CONDUCTOR CABLE."

NASA-MSFC PLUGS NUMBERS 50M72606 AND 50M72607 (Page 1 of 2)

MILITARY SPECIFICATIONS SHEET MIL C 55544/9
 CONNECTORS, ELECTRICAL, ENVIRONMENT RESISTANT 26 December 1968
 FOR USE WITH FLEXIBLE FLAT CONDUCTOR CABLE AND ROUND WIRE
 PLUG, CABLE CONDUCTOR, CYLINDRICAL (FLAT CABLE)
 THE COMPLETE REQUIREMENTS FOR PROCURING THE CONNECTOR DESCRIBED HEREIN
 SHALL CONSIST OF THIS DOCUMENT AND THE ISSUE IN EFFECT OF SPECIFICATION MIL-C-55544

NASA-MSFC PLUGS NUMBERS 50M72606 AND 50M72607 (Page 2 of 2)

MIL-C-55544/9

THE M55544/9 PLUG PARTS SHOWN ARE REQUIRED FOR THE COMPLETED PLUG ASSEMBLY.
THE COMPLETE PART NUMBER IS SHOWN ON TABLE I ON PAGE 2 AND CONSISTS OF (1) EACH
OF THE FOLLOWING MOLDED INTEGRALLY WITH THE PLUG BODY.

WINDOW PIECE - POLYPHENYLENE OXIDE
CONDUCTOR SPACER - POLYPHENYLENE OXIDE
INSULATOR - SILICONE RUBBER

THE PLUG BODY, MOLDED IN PLACE, IS MADE OF POLYPHENYLENE OXIDE
THE SEAL, ASSEMBLED AFTER MOLDING, IS MADE OF SILICONE RUBBER AND CEMENTED TO BODY.
THE SHELL, ASSEMBLED AFTER MOLDING, IS MADE OF COPPER AND NICKEL PLATED.

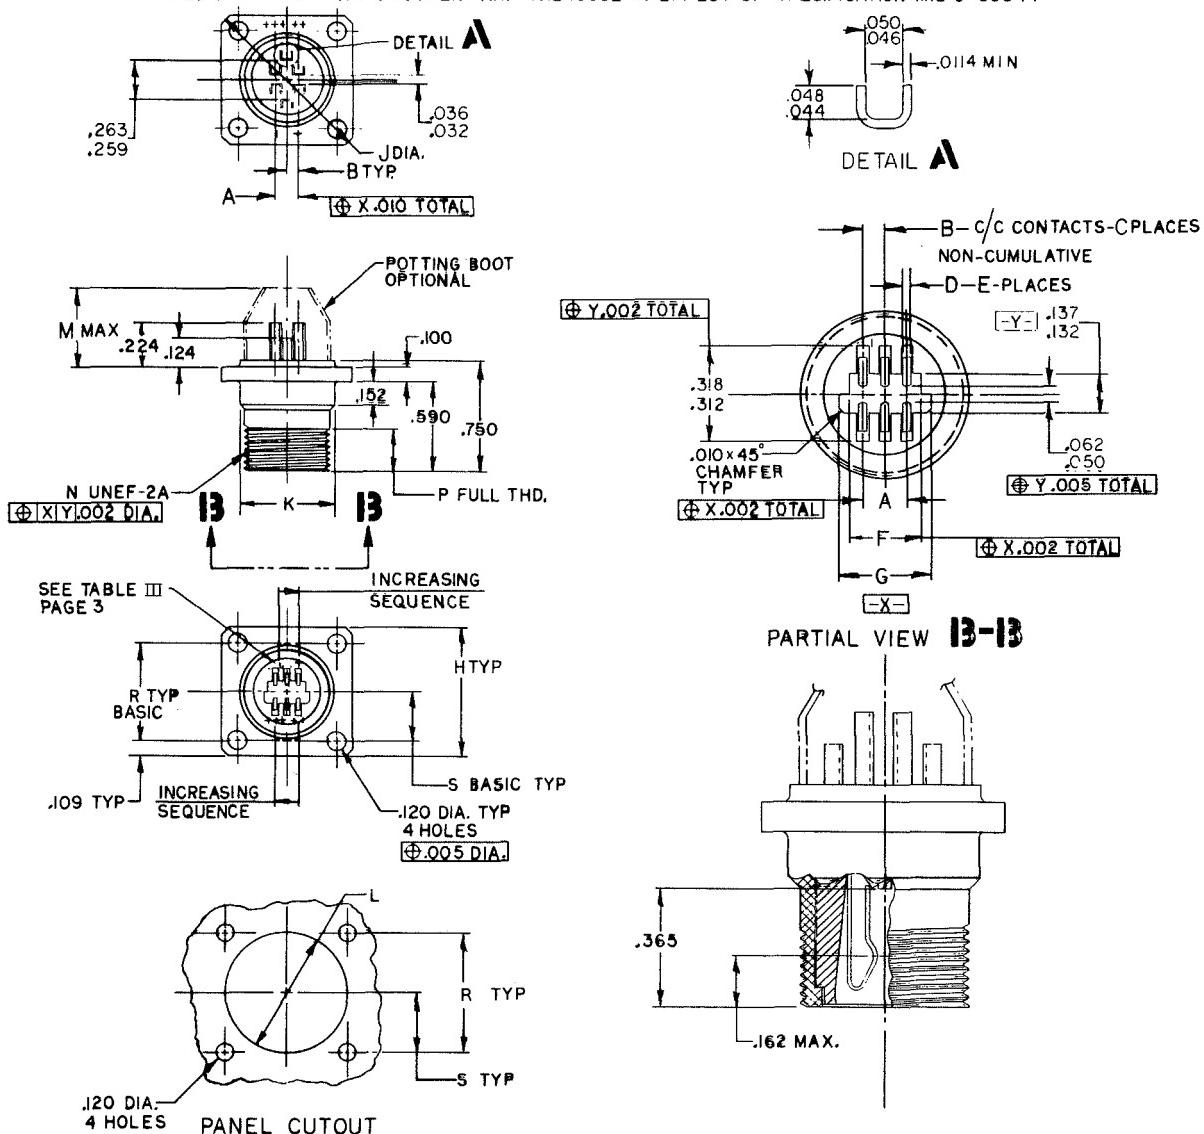

THE CABLE IS NOT PART OF THIS SPECIFICATION, BUT IS TO BE CALLED OUT AS REQUIRED ON
USING DRAWING. THE POTTING MATERIAL WILL ALSO BE CALLED OUT AS REQUIRED ON THE USING
DRAWING.

THE CABLE SHALL BE PREPARED AND THE ABOVE LISTED PARTS SHALL BE ASSEMBLED PER
DRAWING MS75080 "METHOD DRAWING - M55544/9 PLUG ASSEMBLY, FLAT CONDUCTOR CABLE."

NASA-MSFC RECEPTACLE NUMBER 50M72602 (Page 1 of 1)

1. SCOPE

THIS SPECIFICATION DEFINES A POWDERED METAL CRIMP SPLICE TO BE USED AS A TRANSITION FROM AWG 20 STRANDED WIRE TO FLAT COPPER CONDUCTOR .006 X .065.

2. APPLICABLE DOCUMENTS

2.1 THE FOLLOWING DOCUMENTS (AND SUBSIDIARIES THEREOF), OF THE ISSUE IN EFFECT ON DATE OF INVITATION FOR BID OR REQUEST FOR PROPOSAL, EXCEPT AS OTHERWISE NOTED OR CONTROLLED ON AN INDIVIDUAL BASIS, FORM A PART OF THIS DRAWING TO THE EXTENT SPECIFIED HEREIN

SPECIFICATIONS

MILITARY

MIL-T-7928	TERMINALS, LUG AND SPLICE, CRIMP-STYLE, COPPER
MIL-W-81044/12	WIRE, ELECTRIC, CORSSLINKED POLYALKENE, INSULATED, TIN-COATED COPPER, LIGHT WEIGHT, 150°C.
MIL-C-55543/3	CABLE, ELECTRICAL, FLAT, FLEXIBLE, POLYIMIDE/FLUORINATED ETHYLENE PROPYLENE INSULATED, NICKEL COATED STRIP-COPPER CONDUCTOR, 300 VOLT, 200°C.
MIL-T-10727	TIN PLATING; ELECTRODEPOSITED OR HOT-DIPPED, FOR FERROUS AND NON-FERROUS METALS.

STANDARDS

MILITARY

MIL-STD-105	SAMPLING PROCEDURES AND TABLES FOR INSPECTION BY ATTRIBUTES
MIL-STD-130	IDENTIFICATION MARKING OF U.S. MILITARY PROPERTY

AMERICAN SOCIETY FOR TESTING MATERIALS

E-384-69	STANDARD METHOD OF TEST FOR MICRO-HARDNESS OF MATERIALS
----------	---

3. REQUIREMENTS

3.1 THE SPLICES FURNISHED UNDER THIS SPECIFICATION SHALL BE A PRODUCT WHICH HAS BEEN TESTED AND PASSED THE DESIGN EVALUATION TESTS SPECIFIED HEREIN.

3.2 MATERIALS

THE SPLICES SHALL BE FABRICATED OF, OXYGEN FREE, HIGH CONDUCTIVITY COPPER POWDER.

THE SINTERED DENSITY SHALL BE 7.6 GRAMS PER CUBIC CENTIMETER.

SIZE A	CODE IDENT NO. 17773	11269569	
SCALE	—	LTR	B

3.2.1 HARDNESS

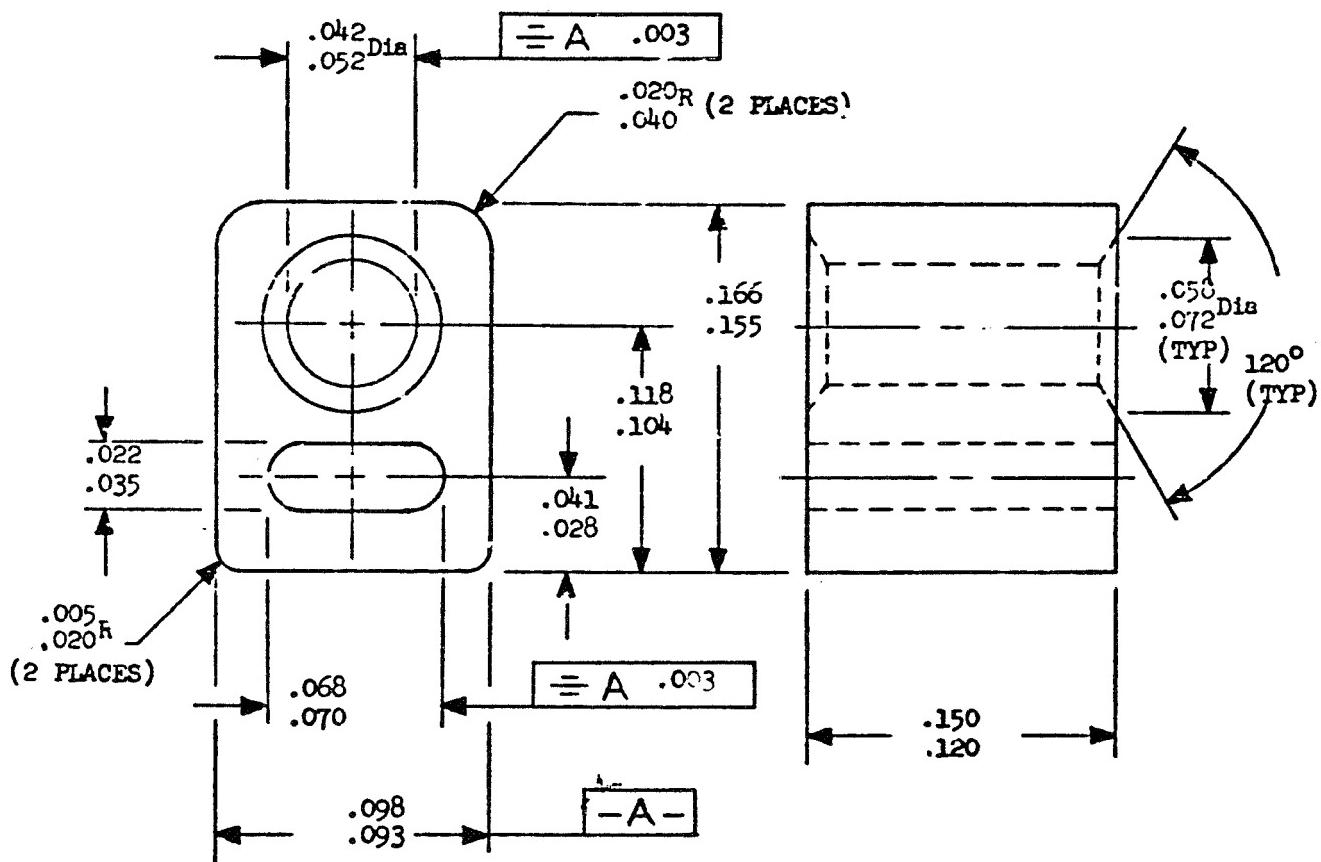

THE PARTS, AFTER SINTERING, SHALL BE MICRO HARDNESS TESTED USING A 500 GRAM KNOOF TEST PROCEDURE PER ASTM E384-69. THE ACCEPTABLE RANGE SHALL BE: 40 - 70, A MINIMUM OF THREE (3) TESTS ARE TO BE MADE ON EACH PART. ANY VALUE RECEIVED FROM AN IMPRESSION THAT FALLS IN AN AREA WHERE A VOID AFFECTS THE READING IS TO BE DISCOUNTED.

3.3 FINISH

PARTS SHALL BE TINNED OVER THEIR ENTIRE AREA WITH TYPE II OF MIL-T-10727.

3.4 DESIGN AND CONSTRUCTION

THE SPLICE SHALL BE CONSTRUCTED AS FOLLOWS:

SIZE A	CODE IDENT NO. 17773	11269569
SCALE <u>NONE</u>	LTR <input checked="" type="checkbox"/>	SHEET <input checked="" type="checkbox"/> 3

3.5 PERFORMANCE

THE SPLICES SHALL BE CAPABLE OF MEETING THE FOLLOWING REQUIREMENTS WHEN CRIMPED TO A NICKEL-PLATED FLAT COPPER CONDUCTOR, .006 X .065 CONFORMING TO MIL-C-55543/3, AND A STRANDED, TIN COATED COPPER CONDUCTOR, AWG 20 CONFORMING TO MIL-W-81044/12.

3.5.1 VOLTAGE DROP

THE VOLTAGE DROP THROUGH THE SPLICE, WHEN CARRYING 4.5 AMPS, SHALL NOT EXCEED 7 MILLIVOLTS BEFORE CURRENT CYCLING, AND 11 MILLIVOLTS AFTER CURRENT CYCLING.

3.5.2 CURRENT CYCLING

PARTS SHALL WITHSTAND 100 CYCLES AT 5.6 AMPS WITHOUT EXCEEDING VALUES NOTED IN 3.5.1.

3.5.3 TENSILE STRENGTH

THE MECHANICAL CONNECTION OF THE WIRES AND THE SPLICE SHALL NOT BREAK OR BECOME DISTORTED BEFORE 12 POUNDS TENSILE PULL IS REACHED.

2.6 IDENTIFICATION

DIRECT PART IDENTIFICATION NOT REQUIRED. IDENTIFY ON CONTAINER OR PACKAGE IN ACCORDANCE WITH MIL-STD-130. IDENTIFY WITH PART NUMBER 11269569.

4. QUALITY ASSURANCE PROVISIONS

4.1 INSPECTION RESPONSIBILITY

INSPECTION RECORDS OF THE EXAMINATION AND TESTS SHALL BE KEPT COMPLETE AND AVAILABLE TO THE PROCURING ACTIVITY AS SPECIFIED IN THE CONTRACT OR ORDER.

THE PROCURING ACTIVITY RESERVES THE RIGHT TO PERFORM ANY OF THE INSPECTIONS SET FORTH IN THE SPECIFICATION WHERE SUCH INSPECTIONS ARE DEEMED NECESSARY TO ASSURE SUPPLIES AND SERVICES CONFORM TO PRESCRIBED REQUIREMENTS.

4.2 CLASSIFICATION OF INSPECTIONS

DESIGN EVALUATION TEST (4.3)

ACCEPTANCE INSPECTION (4.4)

SIZE A	CODE IDENT NO. 17773	11269569	
SCALE —	LTR B	SHEET 4	

4.3 DESIGN EVALUATION TEST

THESE TESTS DETERMINE IF THE DESIGN COMPLIES WITH DESIGN REQUIREMENTS FOR THE ITEM.

THE DESIGN EVALUATION TEST SAMPLES SHALL CONSIST OF 100 PIECES.

THE SAMPLES SHALL BE REPRESENTATIVE OF THE MANUFACTURER'S NORMAL PRODUCTION.
DESIGN EVALUATION TEST SHALL CONSIST OF THE FOLLOWING:

1. VISUAL AND DIMENSIONAL
2. HARNESS
3. VOLTAGE DROP
4. CURRENT CYCLE
5. TENSILE TEST

4.4 PRODUCT ACCEPTANCE INSPECTION

THESE TESTS DETERMINE IF PRODUCTION TECHNIQUES ADVERSELY AFFECT CONFORMANCE TO DESIGN.

ACCEPTANCE INSPECTIONS ARE THOSE INSPECTIONS PERFORMED ON INDIVIDUAL LOTS WHICH HAVE BEEN SUBMITTED FOR ACCEPTANCE. ACCEPTANCE INSPECTIONS SHALL CONSIST OF THE FOLLOWING:

1. VISUAL AND DIMENSIONAL
2. HARNESS
3. VOLTAGE DROP (WITHOUT CURRENT CYCLE)
4. TENSILE

4.4.1 SAMPLING PROCEDURE

A RANDOM SAMPLE SHALL BE SELECTED FROM EACH INSPECTION LOT IN ACCORDANCE WITH MIL-STD-105, GENERAL INSPECTION LEVEL II. THE ACCEPTABLE QUALITY LEVEL (AQL) SHALL BE 1.0 PERCENT FOR MAJOR DEFECTS AND 4.0 PERCENT FOR MINOR DEFECTS.

MAJOR DEFECTS SHALL BE THOSE WHICH INTERFERE WITH THE INSTALLATION AND THE ELECTRICAL FUNCTION OF THE SPLICES. MINOR DEFECTS SHALL BE THOSE THAT ARE OBJECTIONABLE BUT DO NOT RENDER THE SPLICE AS USELESS.

SEVERAL EXAMPLES ARE AS FOLLOWS:

MAJOR DEFECTS

1. ANY DIMENSIONAL DISCREPANCY OUTSIDE SPECIFIC LIMITS.
2. FAILURE TO MEET HARNESS REQUIREMENT.
3. FAILURE TO MEET PERFORMANCE REQUIREMENTS.

MINOR DEFECTS

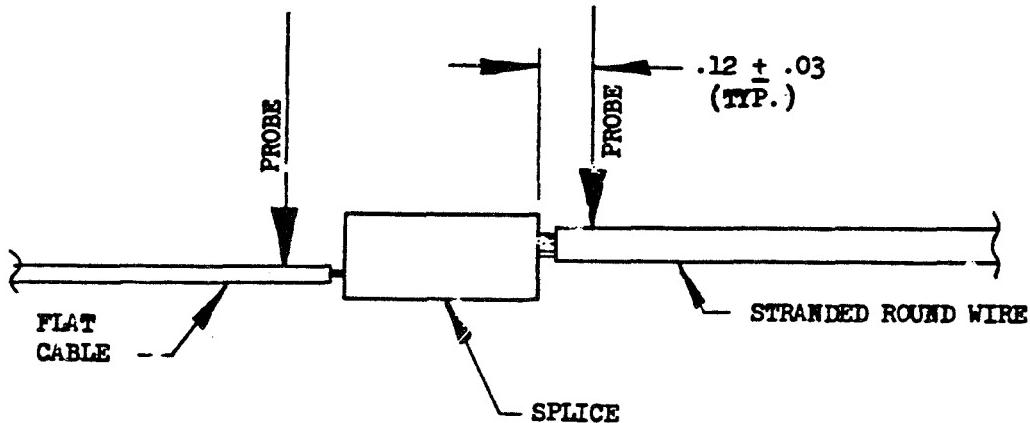

1. EXPOSED COPPER AREAS.
2. SURFACE BLEMISHES OR IRREGULARITIES.

SIZE A	CODE IDENT NO. 17773	11269569	
SCALE —		LTR A	SHEET 5

4.5 TEST CONDITIONS

4.5.1 VOLTAGE DROP

VOLTAGE DROP MEASUREMENTS SHALL BE MADE BEFORE AND AFTER CURRENT CYCLING. MEASUREMENTS SHALL BE MADE BY PUNCTURING THE INSULATION OF THE CURRENT-CARRYING CONDUCTOR ON EACH END OF THE SPLICE. LOCATION OF THE TWO TEST PROBES SHALL BE AS NOTED BELOW. MEASUREMENTS ARE TO BE MADE AFTER TEMPERATURE STABILIZATION.

4.5.2 CURRENT CYCLING

TEST SAMPLES ATTACHED TO THREE FOOT LENGTHS OF APPROPRIATE WIRE SHALL BE SUBJECTED TO 100 CYCLES. EACH CYCLE SHALL CONSIST OF 30 MINUTES AT 5.6 AMPS FOLLOWED BY 15 MINUTES AT NO LOAD.

4.5.3 TENSILE STRENGTH

TENSILE TESTING SHALL BE PERFORMED IN ACCORDANCE WITH MIL-T-7928. BREAKING STRENGTH SHALL NOT BE LESS THAN VALUE NOTED IN 3.5.3.

5. PREPARATION FOR DELIVERY

5.1 PRESERVATION AND PACKAGING

THE SPLICES SHALL BE PACKAGED IN A MANNER THAT WILL INSURE A SAFE, UNDAMAGED, DELIVERY TO POINT OF DESTINATION.

SIZE A	CODE IDENT NO. 17773	11269569	
SCALE —	LTR B	SHEET	6

6. NOTES

6.1 SOURCE OF SUPPLY

THE JHOMAS AND BETTS CO.
ELIZABETH, N. J. 07207

FEDERAL CODE: 59730

MANUFACTURER'S PART NUMBER: 675-53375-2

6.2 INSPECTION LOT

AN INSPECTION LOT IS A COLLECTION OF UNITS OF PRODUCT FROM WHICH A SAMPLE IS DRAWN AND INSPECTED TO DETERMINE COMPLIANCE WITH THE ACCEPTABILITY CRITERIA. EACH LOT SHALL CONSIST OF UNITS MANUFACTURED UNDER THE SAME CONDITIONS AND WITH THE SAME MATERIALS.

6.3 ONLY THE ITEM LISTED ON THIS DRAWING AND IDENTIFIED BY VENDOR'S NAME, ADDRESS, AND PART NUMBER OR IDENTIFIER HAS BEEN TESTED AND APPROVED BY SAFEGUARD SYSTEM COMMAND FOR USE IN MISSILE SYSTEMS.

A SUBSTITUTE ITEM SHALL NOT BE USED WITHOUT PRIOR TESTING AND APPROVAL BY SAFEGUARD SYSTEM COMMAND.

FLAT CONDUCTOR CABLE CONNECTOR SURVEY OF 1970

By W. Angele, Hans G. Martineck, J D Bennight and James D. Hankins

The information in this report has been reviewed for security classification. Review of any information concerning Department of Defense or Atomic Energy Commission programs has been made by the MSFC Security Classification Officer. This report, in its entirety, has been determined to be unclassified.

This document has also been reviewed and approved for technical accuracy.
